QUALITY. INDEPENDENCE. IMPACT.

Agent-Based Modeling: New Methodologies in Impact Analysis

Shubha Chakravarty

PhD Candidate, Department of Economics, Columbia University

Center on Social and Economic Dynamics (CSED), Brookings Institution

GC9 Meeting, Kampala, 15 April 2008

Outline

- Understanding Impact Analysis
- Agent Based Modeling
- ABM: How can it help you
- Methods for Impact Evaluation
- Conclusions: Future Directions

What is Impact Analysis?

- The design, implementation, and evaluation of a social or technological **innovation** in a **real-world setting** that improves the **well-being** of individuals or communities.
- Examples:
 - Introduction of a regulation
 - Creation of a new social program
 - Dissemination of a new technology
- Outcomes of Interest:
 - Health indicators (life expectancy, nutritional status)
 - Economic indicators (GDP, household income)

Stages of Impact Analysis

- Part 1: Before Roll Out
- Designing Roll-out Process
- Modeling Potential Impact
- Part 2: During/After Roll-Out
- Piloting
- Evaluation

Stages of Impact Analysis

- Part 1: Before Roll Out
 - Designing Roll-out Process
 - Modeling Potential Impact
- Part 2: During/After Roll-Out
 - Piloting
 - Evaluation

Designing Roll-Out

- How can we disseminate the innovation so as maximize the potential benefits?
- Considerations:
 - » Decision makers/ Decision Process
 - » Education
 - » Community Leaders/ Politicization
 - » Dissemination Channels

Modeling Potential Impact

- Given the options of how to roll-out or disseminate the innovation, what will the potential impact be on individuals and communities?
 - Will the new innovation be adopted?
 - How fast will it spread?
 - Will the benefits be shared by all?
 - How will it interact with other programs?

Agent-Based Modeling (ABM)

- A general tool to allow researchers and policy makers to simulate social or scientific phenomena in a computerized laboratory setting, in order to better understand how these phenomena will unfold in real-world settings.

ABM: Building Blocks

- Components
- Agents
- Behaviors
- Landscape
- Key Concepts
- Bounded Rationality
- Heterogeneity
- Emergence/Bottom-Up Approach

What is ABM Used For?

- Diffusion/ Contagion processes
- Social Networking applications
- Population Dynamics
- Spatial Analysis
- Most useful for understanding large-scale (macro) implications of individual-level (micro) processes

How to Build an Agent-Based Model

- Domain Experts and Modelers Meet
- Story-Boarding
- First-pass model with basic behaviors
- Iterations to add more complexity

ABM: Examples

- Technology Diffusion
- Agricultural Practices
- Teenage Smoking
- Kayenta Anasazi
- Epidemics

ABM: Examples (2)

ABM: Examples (3)

ABM: How it can Help YOU

- Delivery and Dissemination of Bio-Fortified Staple Crop Species
- How are new crop species adopted, marketed, and consumed?
- How are the benefits of new crop species distributed across society?
- How will the dissemination unfold under different scenarios?

ABM: How Can it Help You To... Design Roll-Out

- What are the best dissemination channels?
- Who should provide extension?
- When should the new varieties be introduced?
- To whom should the new foods be piloted?

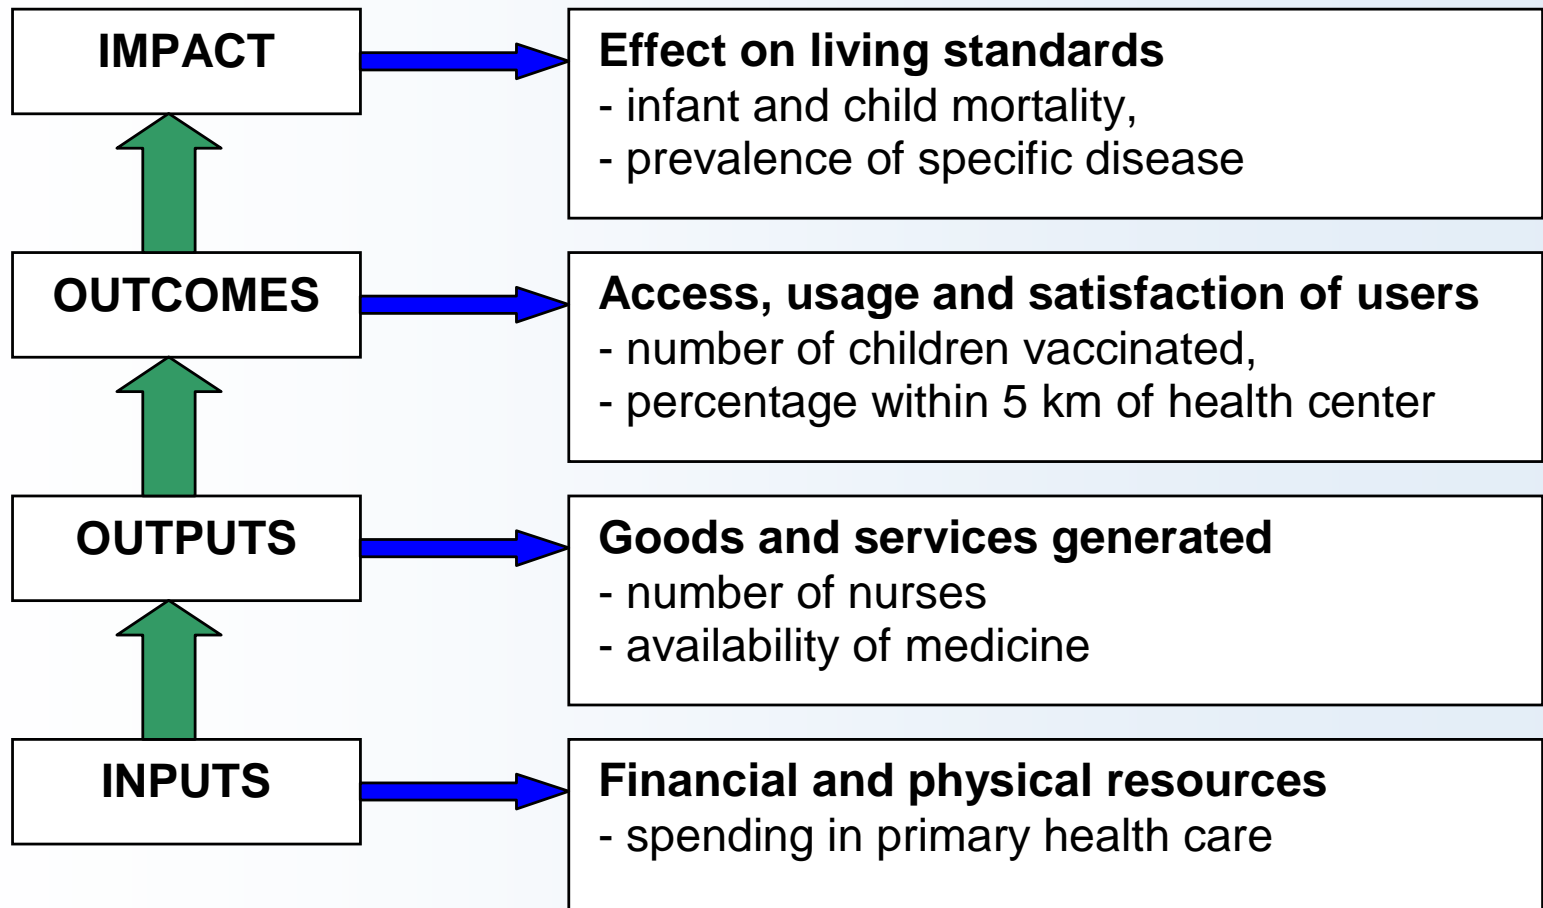

ABM: How Can it Help You To... Model Potential Impact

- How will farmers and consumers benefit from new crop species?
- How will markets be affected by these new foods?
- Heterogeneous effects
- Static vs. Dynamic impacts

Stages of Impact Analysis

- Part 1: Before Roll-Out
- Designing Roll-out Process
- Modeling Potential Impact
- Part 2: During/After Roll-Out
- Piloting
- Evaluation

Impact Evaluation

Impact Evaluation

- Experimental Methods
- Quasi-Experimental Methods
- Non-Experimental Methods
- Qualitative Methods

Experimental/Quasi-Experimental Methods

- Need a comparison group that:
 - » Is as identical as possible in observable and unobservable dimensions to those receiving the program
 - » Will not receive spillover benefits
- How to construct a comparison group (building the counterfactual):
 - » Randomized Controlled Trials (RCT)
 - » Controlled Trials (Difference-in-Difference)
 - » Exploiting spatial and temporal differences in roll-out

Non-Experimental/Qualitative Methods

- Comparing before-and-after measures
- Focus Group Discussions
- Key Informant Interviews

Directions for Future Work

- Using ABM before roll-out to understand process and estimate potential impact
- Using Impact Evaluation after roll-out to identify benefits and beneficiaries
