Key findings for New York include:

Lower income families tend to pay high prices to cash checks and buy short-term loans. In the metropolitan area, high-priced check cashers and pawnshops are very densely concentrated in poor areas. In 2005, there was about one of these establishments in a lower income neighborhood for every 9,314 residents of these neighborhoods, compared to one establishment in the highest income neighborhoods for every 108,350 residents of those neighborhoods.

Most lower income tax filers pay to have their taxes prepared for them. In the metro area, about 67% of low-income tax filers paid for tax preparation services in 2003.

Lower income tax filers buy high-priced refund anticipation loans. In 2003, 11% of low-income filers bought high-priced refund anticipation loans in the New York City metro.

Lower income families tend to pay higher than average prices for auto loans. No data specific to New York City is available, but a 2004 Federal Reserve survey indicates that lower income households pay an average APR of 9.2%, compared to 7.4% paid by all other households.

Lower income families tend to live in the most expensive neighborhoods to insure cars in. In a sample of quotes obtained from three insurance companies, drivers in lower income neighborhoods in the metropolitan area paid an average, annual premium of $1,660, while drivers in the highest income neighborhoods paid an average of $848.

Lower income families are more likely than high-income households to buy high-priced mortgages. In 2004, about 12% of the mortgages originated to lower income households in the New York City metro are defined by the Federal Reserve as high-cost mortgages, compared to 10% of the mortgages originated to the highest income borrowers.

Home insurance is more expensive in lower income neighborhoods. In a sample of quotes obtained from one insurance company, homeowners in lower income neighborhoods in the metropolitan area paid an average, annual premium of $798, while homeowners in the highest income neighborhoods paid an average of $568.

High-priced rent-to-own stores are densely concentrated in New York City’s lower income neighborhoods. In 2005, there was about one rent-to-own establishment in a lower income neighborhood for every 97,938 residents of these neighborhoods, compared to one establishment in the highest income neighborhoods for every 216,700 residents of those neighborhoods.

Higher priced, small grocery stores are concentrated in New York City’s lower income neighborhoods. In 2005, the average grocery store size in a low-income neighborhood is 7,646 sq. ft., compared to an average store size of 27,237 sq. ft. in a non-low-income neighborhood.

To lower these prices, public and private leaders must reduce the higher business costs that drive up prices for poor families, pass new laws and more rigorously enforce existing laws that curb market abuses, and third, and most importantly, invest in giving lower income consumers the know-how to avoid bad deals and find the lowest possible prices. Together, these strategies will give lower income families a powerful tool to lift themselves out of poverty.
