Key findings for Oakland include:

**Lower income families tend to pay high prices to cash checks and buy short-term loans.**
In the city, high-priced check cashers and alternative loan providers are very densely concentrated in poor areas. In 2005, there was about one of these establishments in a lower income neighborhood for every 7,861 residents of these neighborhoods, compared to one establishment in higher income neighborhoods for every 12,084 residents of those neighborhoods.

**Most lower income tax filers pay to have their taxes prepared for them.**
In the metro area, about 55% of low-income tax filers paid for tax preparation services in 2003.

**Lower income tax filers buy high-priced refund anticipation loans.**
In 2003, 6% of low-income filers bought high-priced refund anticipation loans in the Oakland metro.

**Higher-cost tax preparation firms are densely concentrated in Oakland’s lower income neighborhoods.**
There is about one of these establishments for every 2,446 residents of a low-income neighborhood, compared to one for every 8,296 residents of the highest income neighborhoods.

**Lower income families tend to pay higher than average prices for auto loans.**
No data specific to Oakland is available, but a 2004 Federal Reserve survey indicates that lower income households pay an average APR of 9.2%, compared to 7.4% paid by all other households.

**Lower income families tend to live in the most expensive neighborhoods to insure cars in.**
In a sample of quotes obtained from three insurance companies, drivers in lower income neighborhoods in the city paid an average, annual premium of $610, while drivers in the highest income neighborhoods paid an average of $578.

**Lower income families are more likely than other households to buy high-priced mortgages.**
In 2004, about 11% of the mortgages originated to lower income households in the greater San Francisco metro are defined by the Federal Reserve as high-cost mortgages, compared to 6% of loans originated to the highest income households.

**High-priced rent-to-own stores are not densely concentrated in Oakland’s lower income neighborhoods.**
In 2005, there were no rent-to-own furniture stores in Oakland city’s lower income neighborhoods.

**Higher priced, small grocery stores are concentrated in Oakland’s lower income neighborhoods.**
In 2005, the average grocery store size in a low-income neighborhood is 8,208 sq. ft., compared to an average store size of 11,986 sq. ft. in a non-low-income neighborhood.

To lower these prices, public and private leaders must reduce the higher business costs that drive up prices for poor families, pass new laws and more rigorously enforce existing laws that curb market abuses, and third, and most importantly, invest in giving lower income consumers the know-how to avoid bad deals and find the lowest possible prices. Together, these strategies will give lower income families a powerful tool to lift themselves out of poverty.
