

LIVING CITIES: THE NATIONAL COMMUNITY DEVELOPMENT INITIATIVE

NEW YORK

IN FOCUS: *A Profile from Census 2000*

THE BROOKINGS INSTITUTION CENTER ON URBAN AND METROPOLITAN POLICY

ACKNOWLEDGMENTS

The Brookings Institution Center on Urban and Metropolitan Policy has many people to thank for supporting and contributing to the Living Cities databook series.

The center offers its deepest gratitude to Living Cities: The National Community Development Initiative. Living Cities' support has enabled the urban center to analyze the results of Census 2000 through its Living Cities Census Series, of which the databooks are a part.

We are also grateful to Living Cities' member organizations, including AXA Financial, Bank of America, The Annie E. Casey Foundation, J.P. Morgan Chase & Company, Deutsche Bank, Fannie Mae Foundation, Robert Wood Johnson Foundation, W. K. Kellogg Foundation, John S. and James L. Knight Foundation, John D. and Catherine T. MacArthur Foundation, The McKnight Foundation, Metropolitan Life Insurance Company, the Office of Community Services of the U.S. Department of Health & Human Services, Prudential Financial, The Rockefeller Foundation, the Surdna Foundation, and the U.S. Department of Housing & Urban Development for their generous support and partnership on this important project. Living Cities CEO Reese Fayde and Director of Programs Nhadine Leung provided helpful guidance throughout this project.

A further debt of gratitude goes to Sese-Paul Design for the design of this publication.

Final responsibility for the contents of this report rest with the Brookings research team, which consisted of Alan Berube, Ryan Prince, and Hilary Smith, who were supported by Audrey Singer, Mark Muro, Amy Liu, and Bruce Katz. The responsibility for all errors belongs to us.

NOTE: The views expressed do not necessarily reflect those of the trustees, officers, or staff members of the Brookings Institution or the board or staff of Living Cities and its member organizations.

PREFACE

The United States is undergoing a period of dynamic, volatile change, comparable in scale and complexity to the latter part of the 19th century.

Populations are aging—affecting settlement patterns, lifestyle choices, and consumption trends. Diversity is spreading across the map, thanks to the most significant wave of immigration in 100 years. And the nation continues to shift to a knowledge- and service-based economy, placing new demands on education and workforce systems.

For cities and their leaders, such changes make understanding the census much more than an academic exercise. In fact, Census 2000 data are “setting the paradigm” for major political, policy, and economic choices in the coming years, and defining the social context within which these choices are made.

Information about the residential patterns of poor and working poor families is beginning to shape debates on issues as diverse as federal welfare reform, school equity financing, and suburban job, housing, and transportation access. Data on population and economic decentralization are heightening concerns over metropolitan development patterns and their implications for low income workers and neighborhoods. New findings about the changing composition of city populations are affecting local debates over the appropriate mix of housing and city services. In short, to

understand the policy context for cities and neighborhoods requires understanding the census.

New York in Focus: A Profile from Census 2000 seeks to promote such understandings.

One of 23 city-focused databooks keyed to the 23 cities in which the Living Cities consortium focuses its investments, this report by the Brookings Institution Center on Urban and Metropolitan Policy seeks to gauge the health of New York’s neighborhoods and families in an accessible, data-rich format that allows for easy comparisons among cities.

To that end, this and the other databooks has been prepared within a uniform framework. Each book places one of the 23 cities in the context of both the 23 cities in the Living Cities group and the largest 100 cities in the nation. Each organizes demographic and economic data pertaining to ten sets of indicators: population, race and ethnicity, immigration, age, households and families, education, work, commuting, income and poverty, and housing.

At the same time, while each city's databook includes the same indicators and comparisons, each is customized in important ways. The databooks provide tailored presentations and interpretations of every chart, table, and map for the specific city being examined. In addition, each databook presents a localized assessment in the form of an executive summary on how that particular city has performed on key indicators. These assessments focus principally on the central city in each region—in this case New York City—as seen in the context of its region and other cities.

How accurate and current are these statistics and comparisons drawn in large part from Census 2000 in depicting unfolding realities in New York and its region today? We believe very accurate.

Even though this report appears three years after much of the data was collected and a significant slowing of the national economy had set in, the basic profile etched at the height of the last business cycle remains compelling and relevant. First, many of the indicators assembled here are not subject to a great deal of change within three years. Second, the national slump likely alters the relative position of cities in city-by-city comparison only minimally. And finally, the 2000 data—collected at the culmination of an unprecedented period of expansion—represent a kind of high-water baseline that poses a daunting challenge to cities in the current decade. That also continues to make 2000 data compelling, especially since many of the social indicators were troubling even then prior to the weakening of the economy.

At any rate, as America's cities enter the 21st century, Census 2000 provides a unique window of opportunity to assess recent progress and future direction in New York. We hope that these databooks provide individuals and organizations a clear picture of the diverse market and social environments in which cities and neighborhoods operate, and that the reports inform their efforts to create strong and sustainable communities for urban families.

EXECUTIVE SUMMARY

Census 2000 was the first in which New York's population topped 8 million, and the results reveal that the city's recent growth owes to significant immigration from abroad.

During the 1990s, New York's foreign-born population increased by nearly 800,000, helping to make the city one of the most racially and ethnically diverse in the U.S. Immigrants from the Caribbean and Latin America account for roughly half the city's foreign-born population, for example, yet New York also remains one of the foremost U.S. gateways for workers and families from Eastern Europe and China. Such inflows have made New York more youthful, have revitalized many of the city's neighborhoods, and sustained the city's growth in the 1990s despite large declines in its white population. However, segregation levels in New York remain high, with blacks and Hispanics heavily concentrated in different neighborhoods.

Census 2000 also confirms that New York's economic profile weakened somewhat over the course of the decade. The educational attainment of the city's workers increased, but their median household income decreased. The trend reflects a growing number of workers—especially families with children—earning low-to-moderate incomes, as well as the significant number of adults who are not in the labor force. Black and Hispanic households, in particular, lag whites and Asians in college degree attainment, income, and homeownership. Homeownership increased for all groups in the 1990s, but housing costs inordinately burden low-to-moderate income renters in New York, many of whom are minority families.

Along these lines and others, then, *New York in Focus: A Profile from Census 2000* concludes that:

New York's population grew considerably during the 1990s, and the city remains a strong employment center in the region.

Census 2000 reports the story: For the first time, a decennial census recorded a New York population in excess of 8 million. Neighborhoods throughout the city grew, especially in the outer boroughs, and population citywide increased by almost 10 percent. Unlike other cities in the Northeast, New York grew faster than its own suburbs, which include the upstate counties of Putnam, Rockland, and Westchester. Over 90 percent of New Yorkers work within the city—the highest proportion among the 23 Living Cities.

The city owes its population growth and unrivaled diversity to new arrivals from abroad. New York boasts high racial/ethnic diversity, with whites, blacks, and Hispanics each making up at least a quarter of the city's population. This unique mix reflects New York's continued status as one of the nation's important immigrant gateways. The city added nearly 800,000 residents from abroad in the 1990s; without this gain in immigrants, the city would have lost population over the decade. Nearly half of the city's foreign-born come from the

Caribbean and Latin America, but significant numbers also hail from Eastern Europe and East Asia. This diversity is not uniformly dispersed, however. New York's blacks and Hispanics, and blacks and whites, often live in very separate sections of the city.

The city's residents are relatively young, but most have lived in New York for several years. Baby Boomers aged 35 to 54 are by far the nation's largest age cohort, but people aged 25 to 34 make up New York's largest age group. The city's youth, however, belies the fact that more than 87 percent of its residents have lived there for more than five years, one of the highest rates among the Living Cities. New York also ranks high in the proportion of its households that are married couples with children, reflecting the continued immigration of younger Hispanic families to the city. Still, seniors represent a higher-than-average share of the population in New York, and reside in large numbers in neighborhoods at the edges of the city's outer boroughs.

Income disparities in New York widened in the 1990s. New York managed to retain its middle class, unlike many other U.S. cities in the 1990s. At the same time, however, the number of city households earning low-to-moderate incomes, and the number earning high incomes, both grew rapidly. By 2000, more than a quarter of New York households had incomes below \$18,000. Meanwhile, median household income fell 4 percent over the decade, and poverty increased. In part, these trends reflect the relatively low proportion of the city's adults in the labor force (58 percent), and the significant gap that exists in median household income by race and ethnicity (\$51,000 for whites, \$28,000 for Hispanics). These income differences are rooted in

divergent patterns of higher educational attainment. Compared to whites and Asians, black and Hispanic adults in New York are much less likely to hold a college degree.

All racial and ethnic groups made progress on homeownership over the decade, but New York remains a city of renters, many of whom face growing cost burdens. Overall, New York has the third-lowest homeownership rate among large U.S. cities, reflecting the high cost of its housing, the young age profile of its residents, and its large multifamily housing stock. Still, all racial and ethnic groups—African Americans, in particular—managed to make homeownership gains in the 1990s. For New York renters looking to graduate to homeownership, though, the barriers to accumulating savings are clear. The typical monthly rent in New York is third highest among Living Cities, and over half of moderate-income renters—those earning \$20,000 to \$35,000 a year—bear significant housing cost burdens. These burdens were likely exacerbated by the 8 percent rise in rental costs in New York in the 1990s, putting new pressures on the city's supply of affordable housing.

By presenting the indicators on the following pages, *New York in Focus: A Profile from Census 2000* seeks to give readers a better sense of where New York and its residents stand in relation to their peers, and how the 1990s shaped the city, its neighborhoods, and the entire New York metro area. Living Cities and the Brookings Institution Center on Urban and Metropolitan Policy hope that this information will prompt a fruitful dialogue among city and community leaders about the direction New York should take in the coming decade.

METHODOLOGY AND DEFINITIONS

The information presented in *New York in Focus: A Profile from Census 2000* derives almost entirely from the U.S. decennial censuses conducted in April 1990 and April 2000. The decennial census is the most comprehensive source of information on the U.S. population, and because all U.S. households are interviewed, it is unique in its ability to describe population characteristics at very small levels of geography.

The decennial census is comprised of two separate but related surveys.

In the “short form” survey, all households in the U.S. are asked a series of basic questions on age, race/ethnicity, sex, the relationships among household members, and whether or not the home was owned or rented. Approximately one in six households receives a “long form” survey that asks, in addition to the short form questions, more detailed questions on social, economic, and housing characteristics. The Census Bureau employs statistical weighting to extrapolate from the long form data to arrive at a representative portrait of all U.S. households.

Geography provides the framework for interpreting and understanding census data. The Census Bureau tabulates information from the decennial census for a range of geographies. In this databook, we present information for several different levels of geography:

Cities—Many of the tables and charts show citywide data. In this databook, New York is compared to the other 22 Living Cities, to the other 99 cities among the 100 largest in the nation, and to other Living Cities located in the Northeast region of the U.S. (Boston, Newark, and Philadelphia).

Metropolitan areas—Metro areas are established by the federal Office of Management and Budget (OMB) to represent a collection of highly-populated communities that exhibit a high degree of economic interdependence. As such, they roughly characterize regional labor markets. Where metro-area-level data are presented in this databook, those data represent either the OMB-defined Metropolitan Statistical Area (MSA—a metro area not closely associated with another) or the Primary Metropolitan Statistical Area (PMSA—a metro area representing one part of a larger area with one million or more people). In this

databook, the New York metro area—which OMB designates as the New York, NY PMSA—consists of New York City (Bronx, Kings, New York, Queens, and Richmond counties) and three counties to the city’s north in the state of New York: Putnam, Rockland, and Westchester. Several other counties in the immediate area, such as Nassau County, NY, and Bergen County, NJ, are considered parts of other PMSAs.

Suburbs—Information for suburbs is sometimes presented alongside that for cities. We define suburbs as the part of the metro area located outside the central city. In the case of New York, the suburbs include Putnam, Rockland, and Westchester counties.

Census tracts—Census tracts are subdivisions of counties defined by the Census Bureau to contain between 1,000 and 8,000 people; most contain 3,000 to 4,000 people, and most researchers equate urban census tracts with neighborhoods. We map several indicators at the census tract level to demonstrate differences among neighborhoods in New York and its suburbs.

This databook primarily focuses on how the population, employment, and housing characteristics of New York and its neighborhoods compared to those in other cities in 2000, as well as how those characteristics changed between 1990 and 2000. Data from the Census 2000 short form have been available since summer 2001, and data from the long form followed one year later. Thus, many of the tables, charts, and maps shown in this databook derive from survey data collected a little over three years ago.

A note on the timeliness of this data: Though much of it dates to 2000, these data remain accurate, relevant, and compelling. The age profile of

the population, characteristics of housing stock, and average size of households—none of these, for starters, are likely to change significantly within a period of a few years. At the same time, the numerous comparisons of cities on or another on these indicators likely hold. To the extent that larger national trends—aging of the population, or increasing enrollment in higher education—alter city conditions, they alter all cities. That means the relative rankings of cities are not subject to dramatic change. Finally, trends between 1990 and 2000 are important in their own right, as they show the progress cities made during a period of unprecedented economic expansion. That progress establishes a baseline for city performance during the 2000–2010 decade.

At the same time, though, the economy did enter a downturn soon after Census 2000 was conducted, and the effects are still being felt today in the labor market—through increased unemployment, stagnant incomes, and rising poverty. We have used post-census data, where available, to provide a more up-to-date picture of employment in cities. Most demographic surveys conducted between decennial censuses, however, do not include large enough samples to provide descriptions of changing conditions at the local level. In the Current Population Survey, for instance, states (and in some cases, metropolitan areas) are the smallest geographical units for which labor force statistics are available.

Some federal agencies do, however, collect annual demographic and economic data for sub-state levels of geography between decennial censuses. Following is a list of topics and intercensal data sources available from the federal government that individuals and organizations working at the local level can use to track and update changes in the indicators presented in this databook:

Population—The Census Bureau’s Intercensal Population Estimates Program provides population estimates for metropolitan areas, counties, cities, and towns between decennial censuses. These estimates are based on population counts from the most recent census, adjusted using data from local records. Data are published annually, delayed approximately one year from the date at which they are estimated. See eire.census.gov/popest/estimates.php.

Age and race/ethnicity—The same Census Bureau program publishes population estimates annually by age and race/ethnicity for geographies down to the county level—similar estimates are not available for cities. The first post-census update of these data (estimates as of July 2002) will be made available in summer 2003.

Migration—The Internal Revenue Service publishes county-to-county migration files that allow users to track, on an annual basis, the origins, destinations, and incomes of families migrating between counties and metropolitan areas. Data are released annually for migration flows two years prior. See “Tax Stats” at www.irs.gov.

Work—The Bureau of Labor Statistics, through its Local Area Unemployment Statistics program, publishes monthly estimates of total employment and unemployment for counties, metropolitan areas, and cities with populations of at least 25,000. Data are released monthly on the employment situation two months prior. See www.bls.gov/lau/home.htm.

Income and poverty—The Census Bureau Small Area Estimates Branch employs several federal data sources to produce annual estimates of poverty rates and median household incomes for all states and counties, as well as poverty rates for all school districts. These data are published with an approximate three-year lag. See www.census.gov/hhes/www/saie.html.

Housing—The Federal Financial Institutions Examination Council—a consortium of the federal banking regulators—publishes data annually on all mortgages originated in the U.S. by financial institutions, with detail down to the census tract level. These data can be used to track homeownership and home value trends in metro areas, counties, cities, and neighborhoods. Data are released each summer for mortgages originated in the prior year. See www.ffiec.gov/hmda/publicdata.htm.

State and local data—To administer programs and make policy, state and local agencies also track a wealth of administrative data that can reveal much about the social and economic health of individuals and families in cities and neighborhoods. For a comprehensive guide to the types of state and local administrative data that can be used to describe small areas, see “Catalog of Administrative Data Sources,” by Claudia Coulton with Lisa Nelson and Peter Tatian, available at www.urban.org/nnip/publications.html.

POPULATION

Population growth does not by itself define a city's health. Nevertheless, the fact that people “vote with their feet” makes population change a good first-order indicator of the appeal of a place. This section accordingly details the basic population trajectory of New York and its neighborhoods during the 1990s.

Nationwide, the U.S. added 32.7 million people in the 1990s, the largest intercensal population increase in its history. Growth was widespread—Every state in the union added people, the first time this had occurred in the 20th century. Moreover, historically high levels of international immigration supplemented significant “natural increase”—an excess of births over deaths—in fueling the nation's population growth.

And yet, not all places in the U.S. shared equally in the broader population increase. The South and West absorbed more than three-quarters of the nation's growth in the 1990s. Cities added population at a faster rate than they had in either the 1970s or 1980s, but suburbs grew nearly twice as fast. And even within cities, core neighborhoods around the downtown in many cases lost population, while “outer-ring” neighborhoods at the urban periphery expanded rapidly.

The indicators on the following pages begin to display these trends by depicting population change in New York City and its metropolitan area, in other cities and regions, and in New York's own neighborhoods.

POPULATION

New York is the nation's largest city with over 8 million residents*Total population, 2000: Living Cities and 100 largest cities*

New York was the only Living City in the Northeast to grow faster than its suburbs in the 1990s

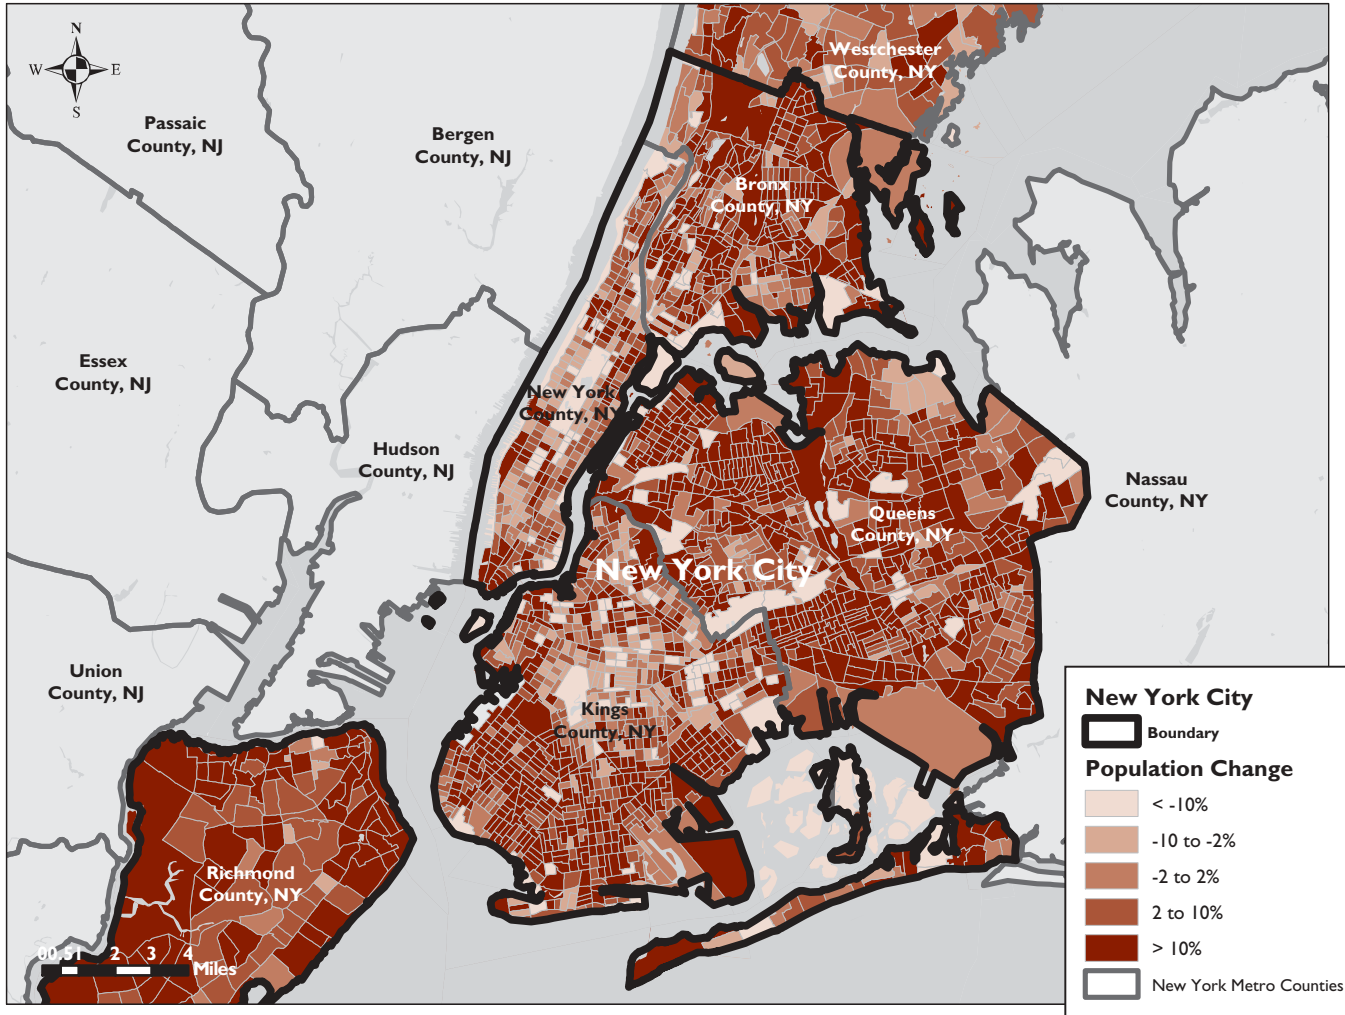

Percent population change, 1990–2000: Northeastern U.S. Living Cities metro areas

POPULATION

Neighborhood population growth was widespread throughout New York, especially in the outer boroughs

Percent population change, 1990–2000: New York metro area

RACE AND ETHNICITY

Cities also need to understand how their racial and ethnic compositions are changing, so they can decide how to fund and deliver services to meet the needs of increasingly diverse populations. In particular, the growing representation of Latinos, whose families tend to be younger and to have more children, suggests cities need to take a closer look at schools, public health, and other programs that primarily serve the young.

The overall racial and ethnic profile of the U.S. population is changing rapidly. Census 2000 confirmed that nationwide, the Hispanic population had grown to roughly the same size as the African American population. Although smaller in size, the Asian population was also on the rise in the U.S. in the 1990s, and grew more than 50 percent over the decade. Adding richness to these trends was the fact that Census 2000 was the first census to offer respondents the option of selecting more than one race category to indicate their family members' racial identity. Nearly 7 million people, or 2.4 percent of the population, reported multiple races.

In keeping with these changes, Census 2000 revealed that for the first time, the 100 largest cities in the U.S. were "majority minority;" that is, more than half of their combined population was either non-white or

Hispanic. This trend owed to large gains in Latino population in nearly all cities, modest growth in Asian and African American populations, and widespread declines in non-Hispanic whites. Growing diversity was not confined to the cities, either. Minority population share in the largest suburbs also rose sharply, from 19 percent in 1990 to 27 percent in 2000.

This section compares New York's racial and ethnic makeup to that of other cities, and examines how it changed in the 1990s. It also probes the differing racial profiles of the city's various age groups and neighborhoods.

A NOTE ON RACE/ETHNICITY TERMINOLOGY

Many of the tables, charts, and maps presented in this and subsequent sections feature data specified for certain racial and ethnic groups. This note describes in greater detail how those groups are defined and shown in this databook.

The federal government considers race and Hispanic origin distinct concepts and therefore captures information on them in two separate questions on census forms. On the Census 2000 survey, respondents were first asked to identify whether they were of “Spanish, Hispanic, or Latino” origin, and were then asked whether they are white, black, one of several Asian ethnicities, American Indian or Alaska Native, Native Hawaiian or other Pacific Islander, or “some other race.” For the first time, respondents could check off more than one race to describe themselves. Combining the race and Hispanic origin responses yields 126 possible race-ethnic combinations.

To simplify the presentation of data, and to conform with many of the tables generated by the Census Bureau itself, this databook uses shorthand terms for the racial and ethnic descriptors respondents chose to characterize themselves and their family members:

- “Hispanic or Latino” is used to refer to individuals or households who indicate Spanish, Hispanic or Latino origin, regardless of their race. Nationally, nine out of ten Census 2000 respondents who indicated Hispanic origin, reported their race as either “white” alone or “some other race” alone.
- Where available, information for individuals who indicate more than one race is presented in a “Two or more races” category. Nationally, only 2.4 percent of Census respondents identified more than one race.

Remaining race categories in this databook include respondents who reported that race alone, not in combination with any other race. However, because Hispanic origin is determined in a separate question, people of these races may also be Hispanic or Latino. Generally, race-specific population and household counts include only non-Hispanics. Race-specific economic variables generally include members of those groups who also reported Hispanic origin.

- “Black/African American” refers to individuals who chose this race designation.
- “Asian/Pacific Islander” was combined from two race totals, “Asian” and “Native Hawaiian and Other Pacific Islander,” for comparability with the 1990 Census.
- In general, “Other race” is used to refer to individuals who indicated “some other race” or “American Indian or Alaska Native” race.
- “White” at all times (even for economic variables) refers to non-Hispanic whites.

This streamlined set of race/ethnic categories, as well as the format in which the Census Bureau makes the data available, precludes the presentation of data for country-specific groups, such as Mexicans or Vietnamese, or for foreign-born individuals in general. Individuals and households in these groups are included in the broader race/ethnic categories shown here. Readers interested in profiles for many of these groups can access data online through Census 2000 Summary File 2 (SF 2) and Summary File 4 (SF 4) at www.census.gov.

New York's population is highly diverse, and nearly two-thirds of residents are non-white or Hispanic

Hispanic and Asian populations grew rapidly in New York during the 1990s, as the white population shrank considerably

Population change by race/ethnicity, 1990–2000: New York metro area

Whites represented 35 percent of New York's population in 2000, down from 43 percent in 1990

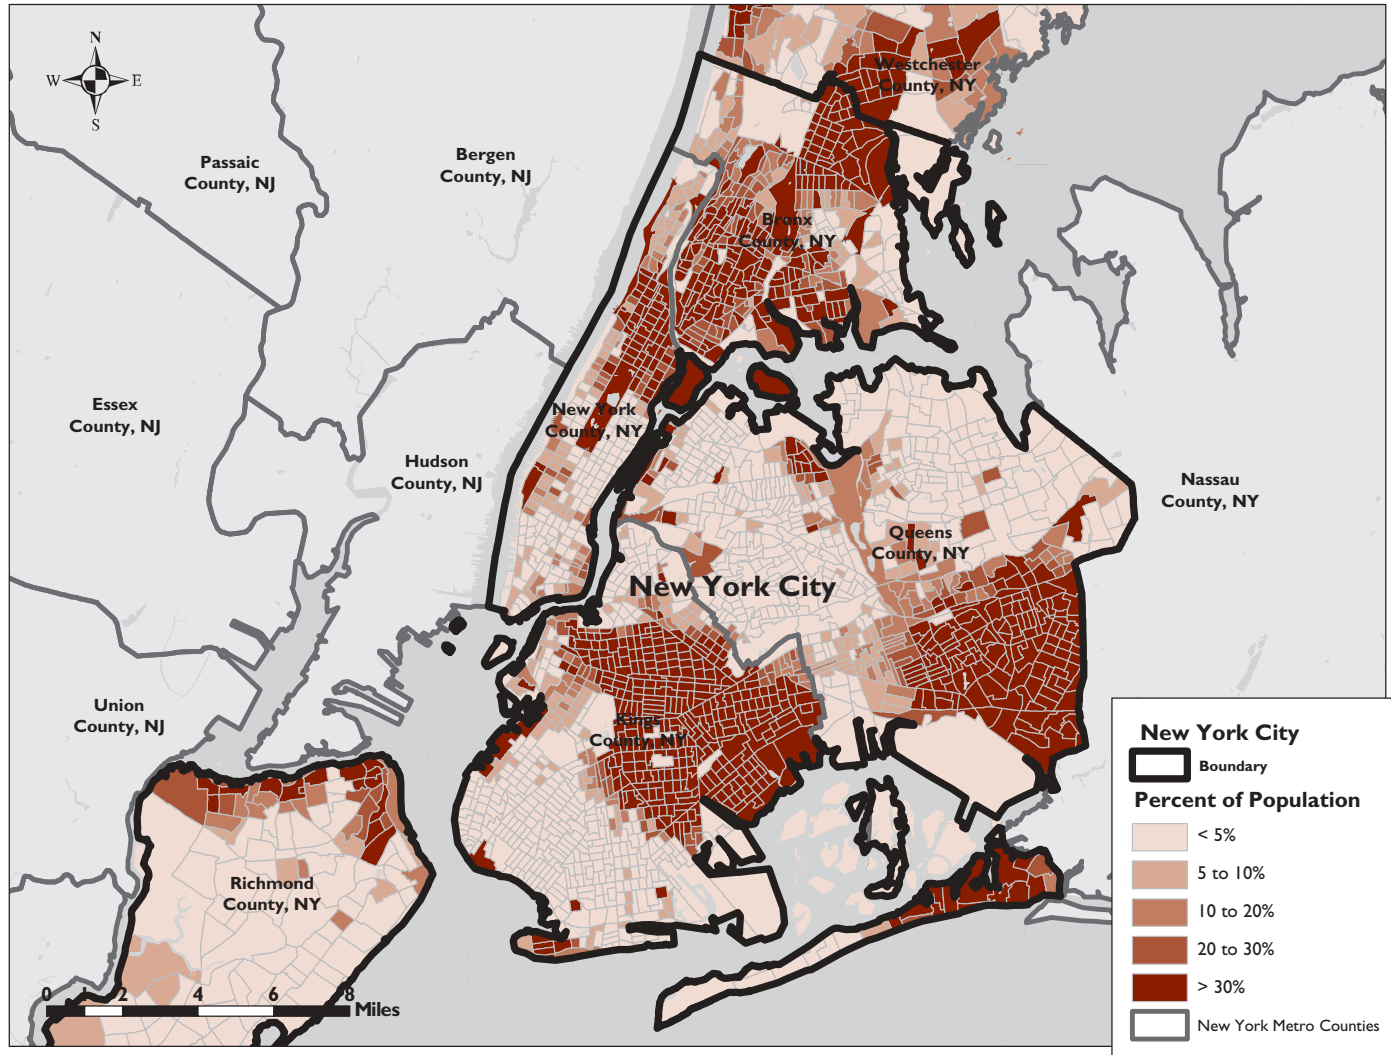

Population share by race/ethnicity, 1990–2000: New York

*Census 2000 was the first census in which respondents could choose more than one race to classify themselves

The black population in New York is concentrated in Harlem, the south Bronx, eastern Brooklyn, and Jamaica, Queens

Black/African American population share, 2000: New York metro area

Hispanics represent a large share of the population in Washington Heights, the Bronx, Williamsburg, and western Queens

Hispanic or Latino population share, 2000: New York metro area

Among the nation's 100 largest cities, New York ranks second-highest on Hispanic-white segregation, and highest on black-white segregation

Dissimilarity index by race/ethnicity, 2000: Living Cities and 100 largest cities*

*The dissimilarity index can be interpreted as the proportion of one group that would have to move to another neighborhood to achieve the same population distribution as the other group. Indices are based on census tracts for all central cities in each Living City's respective metro area. For New York, indices include residents of New York and White Plains.

IMMIGRATION

At the turn of the 21st century, understanding the characteristics of growing foreign-born populations is central to understanding the social, economic, and political dynamics of cities. The following pages, for this reason, chart the magnitude, recency, and sources of international immigration to New York and its suburbs.

A growing foreign-born population in U.S. cities and suburbs underlies Census 2000 findings on race and ethnicity. An influx of immigrants, mostly from Latin America, the Caribbean, and Asia, helped to sustain population growth in a majority of the nation's largest cities in the 1990s. All told, Census 2000 identified 31 million foreign-born individuals living in the U.S., representing approximately 11 percent of the population. This was up dramatically from 1970, when slightly less than 5 percent of the U.S. population was foreign-born. Overall, just over one-half of the total foreign-born population in the U.S. came from Latin America, and more than 40 percent of U.S. immigrants arrived after 1990. In 2000, the 100 largest cities alone were home to over 11 million immigrants, accounting for one in five residents.

While immigrant populations grew in nearly every large U.S. city in the 1990s, a growing proportion of the foreign-born are living in suburbs. The suburbanization of immigrants is especially pronounced in fast-growing "emerging gateway" metropolitan areas in the South and West, including Atlanta, Dallas, and Washington, D.C. In these metros, a majority of recent immigrants to the area are bypassing cities and settling directly in the suburbs. Even central cities with a long-established and continuing immigrant presence, like New York and Los Angeles, are witnessing rapid growth of foreign-born populations in their own suburbs.

Over one-third of New York residents are foreign-born, the third-highest proportion among the 23 Living Cities

Foreign-born population share, 2000: Living Cities and 100 largest cities

IMMIGRATION

Unlike other northeastern Living Cities where immigrants located largely in the suburbs, New York added roughly 12 times as many foreign-born residents in the city as in its northern suburbs

Foreign-born population change, 1990–2000: Northeastern U.S. Living Cities metro areas

New York ranks fifth among Living Cities in the proportion of its immigrants who are naturalized U.S. citizens, even though a significant number of the foreign-born arrived in the 1990s

Foreign-born population by citizenship and year of entry, 2000: Living Cities

New York has one of the most diverse foreign-born populations in the U.S., with the Caribbean representing the most common source region

Share of foreign-born by region of birth, 2000: New York

One in eight foreign-born residents of New York hails from the Dominican Republic, but nearly half come from countries outside the top ten

Population and share of foreign-born by country of birth, 2000: New York

* Excluding Hong Kong and Taiwan

AGE

The age profile of a city's population can answer some very basic questions about a city's ability to provide for its residents.

For instance, the number of working-age residents from whom the city can raise revenue influences the level of services it can provide for more “dependent” residents like the elderly and children. Likewise, the city's ability to “compete” nationally, within its region, and within its neighborhoods for younger workers may hint at its prospects for continued vitality in the future.

Age profiles nationwide, and in most cities and metro areas, are dominated by the aging of the Baby Boom generation. In 2000, that generation roughly corresponded with the 35-to-54 year-old age group, which represented nearly 30 percent of the U.S. population. The movement of Baby Boomers into these age groups in the 1990s meant that by Census 2000, for the first time, more than half the nation's population was age 35 and over. The Northeast was the nation's oldest region, with a median age just under 37; the West was the youngest, with a median age under 34.

Cities are younger places in general than suburbs—46 percent of central city residents in 2000 were more than 35 years old, compared to 51 percent of suburban residents. And the older population in cities barely grew at all in the 1990s, due in large part to the earlier migration of pre-retirees and seniors to suburbs. Despite the continued appeal of cities for young professionals, in 2000 a majority (63 percent) of 25-to-34 year-olds in major metro areas lived in the suburbs. Over the 1990s, though, the number of children in cities rose, thanks to higher birth rates among the growing population of younger immigrant families.

To probe such trends, the following indicators profile the relative size and age of New York's population and its sub-groups in the city and its neighborhoods, and identify changes over the 1990s.

Women and men aged 25 to 34 are New York's largest age groups

Population by 5-year age groups, 2000: New York

Every 100 working-age adults in New York help to support 56 children and seniors, similar to the average Living City

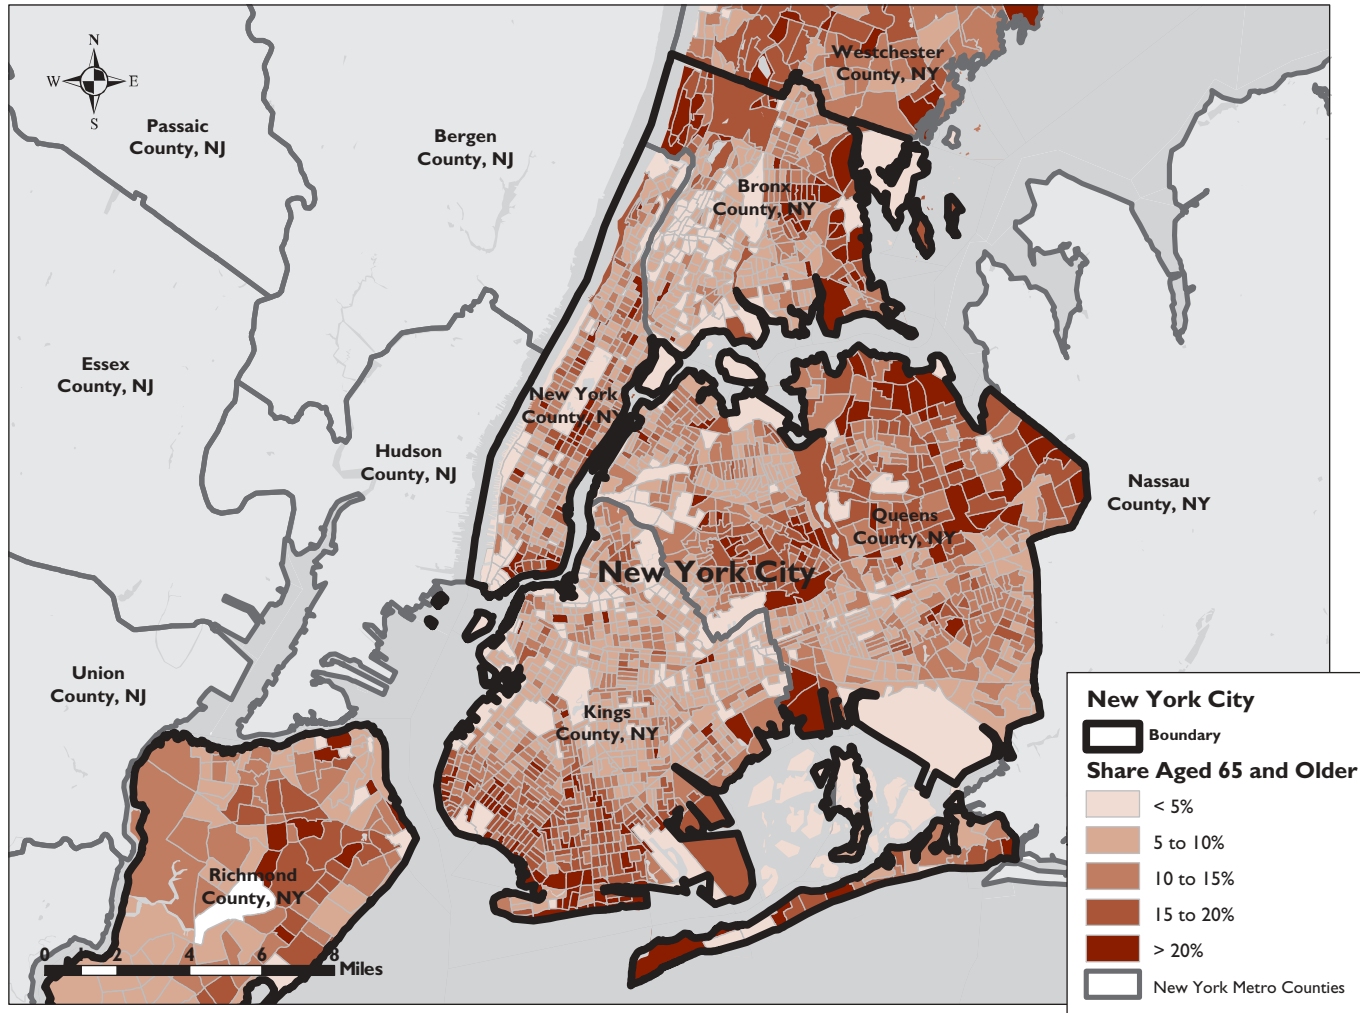

Dependency ratio and share of population by age group, 2000: Living Cities*

Rank	Living Cities	Dependency Ratio	Children (0–17)	Working-age (18–64)	Elderly (65+)
1	Detroit, MI	71	31.1%	58.5%	10.4%
2	Cleveland, OH	70	28.5%	59.0%	12.5%
3	Philadelphia, PA	65	25.3%	60.6%	14.1%
4	San Antonio, TX	64	28.5%	61.0%	10.4%
5	Miami, FL	63	21.7%	61.2%	17.0%
6	Baltimore, MD	61	24.8%	62.0%	13.2%
7	Newark, NJ	59	27.9%	62.8%	9.3%
8	Kansas City, MO	59	25.4%	62.9%	11.7%
9	Phoenix, AZ	59	28.9%	63.0%	8.1%
10	Indianapolis, IN	58	25.7%	63.4%	11.0%
11	Chicago, IL	58	26.2%	63.4%	10.3%
12	Los Angeles, CA	57	26.6%	63.8%	9.7%
13	New York, NY	56	24.2%	64.1%	11.7%
14	Oakland, CA	55	25.0%	64.6%	10.5%
15	Dallas, TX	54	26.6%	64.8%	8.6%
16	Minneapolis-St Paul, MN	51	24.2%	66.2%	9.6%
17	Denver, CO	50	22.0%	66.8%	11.3%
18	Columbus, OH	49	24.2%	67.0%	8.9%
19	Portland, OR	48	21.1%	67.4%	11.6%
20	Washington, DC	48	20.1%	67.7%	12.2%
21	Atlanta, GA	47	22.3%	67.9%	9.7%
22	Boston, MA	43	19.8%	69.8%	10.4%
23	Seattle, WA	38	15.6%	72.4%	12.0%
	All Living Cities	57	25.2%	63.9%	10.9%
	Nation	62	25.7%	61.9%	12.4%

*The dependency ratio represents the number of children and seniors for every 100 adults age 18 to 64.

Seniors predominantly live in neighborhoods at the edge of New York's outer boroughs

Share of population 65 and older, 2000: New York metro area

Relative to the nation, New York experienced significant growth in its child population (age 0 to 14) and sustained its young adult population (25 to 34)

Percent population change by age group, 1990–2000: New York and U.S.
