6. Metropolitan areas are defined by the U.S. Office of Management and Budget to include an urbanized area of 50,000 residents, its home county or counties, plus any adjacent counties that maintain commuting and other economic ties to the core urbanized area. Thus, metropolitan areas are county-based. Current definitions of metropolitan areas are available at [www.census.gov/population/www/estimates/metrodef.html](http://www.census.gov/population/www/estimates/metrodef.html) (June 1 2008).
7. For extended articulations of this perspective on the desired nature of national and regional development and the key "drivers" of such prosperity, see Alan Berube, "MetroNation: How U.S. Metropolitan Areas Fuel American Prosperity" (Washington: Brookings Institution, 2007) and Mark Muro and others, "MetroPolicy: Shaping a New Federal Partnership for a Metropolitan Nation" (Washington: Brookings Institution, 2008).

  58. The Metropolitan Institute at Virginia Tech projected population and employment through 2040 for the five megapolitan areas, the five states, and the United States as a whole. The national population projections were initially based on the U.S. Census Bureau's 1999 projections through 2100, which identified low, middle, and high growth scenarios based on fertility, longevity, and immigration. For more information, see U.S. Census Bureau, "Population Projections of the United States by Age, Sex, Race, Hispanic Origin, and Nativity: 1999 to 2100." (Washington, 2000). The Metropolitan Institute assumed that growth through 2040 would track between the middle and high growth scenarios, based on rapid recent growth between 1999 and 2007. Growth through 2040 was then apportioned to states and to megapolitan geographies based on a constant-share analysis in accordance with each area's growth rates between 1996 and 2006. The employment projections were initially based on county population and jobs projections from Woods & Poole through 2030, and then extended to 2040 by multiplying the jobs per capita values for 2030 by the 2040 population estimates. For more information, see [www.woodsandpoole.com](http://www.woodsandpoole.com)
  59. Using the growth projections, the Metropolitan Institute at Virginia Tech projected real estate investment in the nation's megapolitan areas based on a formula that calculates demand for both new and replacement structures and public infrastructure needs to accommodate this growth. The projection method assumes that not all real estate has the same durability. For example, residential development endures the longest without replacement. According to U.S. Census Bureau data, housing can last 150 years. By contrast, certain commercial real estate, such as big box retail, may need replacing in 10 to 15 years. Office buildings generally remain in use longer and are often occupied for several decades. The projection method first assessed the total volume of housing units and commercial space that would be needed in 2040, based on population and employment projections and using current ratios of housing units to population and jobs to commercial floor space from U.S. Census Bureau surveys. Decay rates for existing buildings were then computed based on surveys of building age to determine the share of existing building stock that would need to be rebuilt. The difference between the total needs in 2040 and the rebuilt shares is the "growth-related" stock.

  134. The Center for Measuring Research Performance ranks schools based on their federal research dollars generated, their endowments, and their faculty quality (using such measures as members in the national academies). The rankings apply to schools classified as "Research University/Very High" (RU/VH) according to the Carnegie Foundation's classification system. Only 96 schools (out of over 3,500 colleges and universities in the U.S.) meet the standards to receive RU/VH. These used to be referred to as "Research 1" universities under the old Carnegie Classification of Institutions of Higher Education to show which institutions received the most federal support for science research. The next level of research university is RU/H for Research Universities (high research activity), followed by DRU or Doctoral/Research Universities. The Center for Measuring University Performance, "American Research University Data," available at [http://mup.asu.edu/research\\_data.html](http://mup.asu.edu/research_data.html) (December 1 2007).
