# Productivity Growth in Health Care

**John A. Romley, PhD**

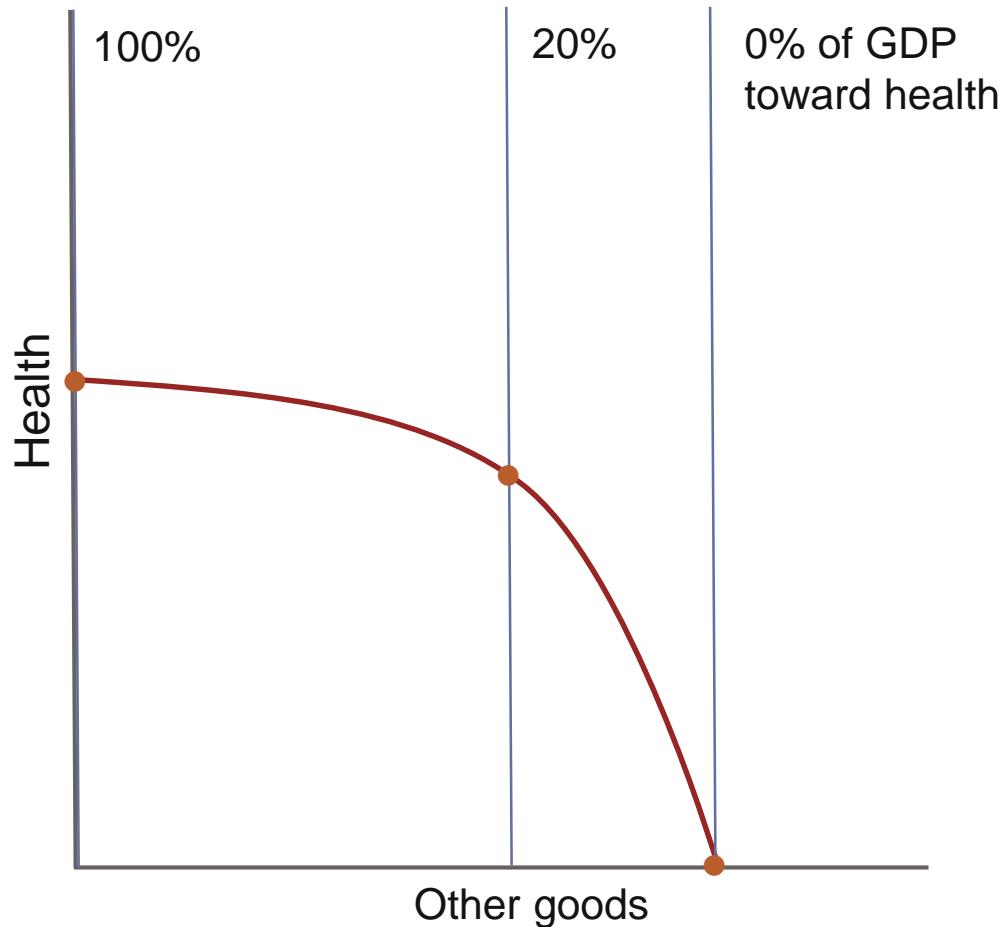

Associate Professor

USC Schaeffer Center for Health Policy & Economics

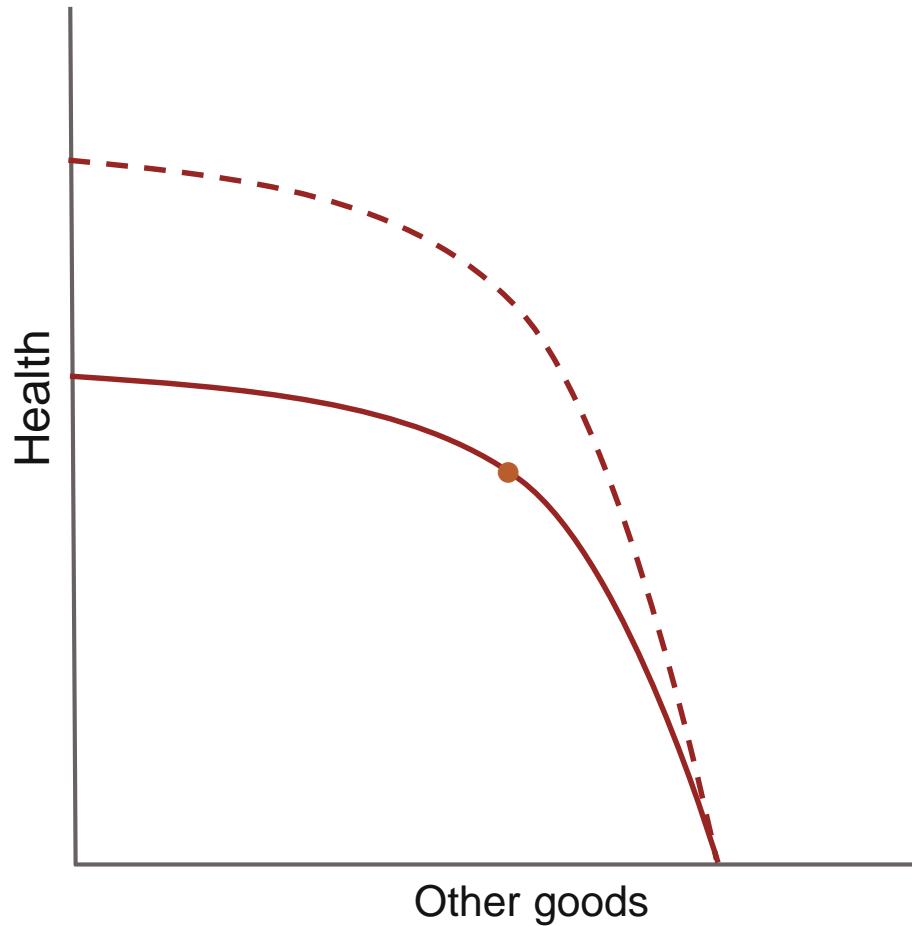

USC Price School of Public Policy

USC School of Pharmacy

## A little health economic theory: Possible combinations of health and goods for society

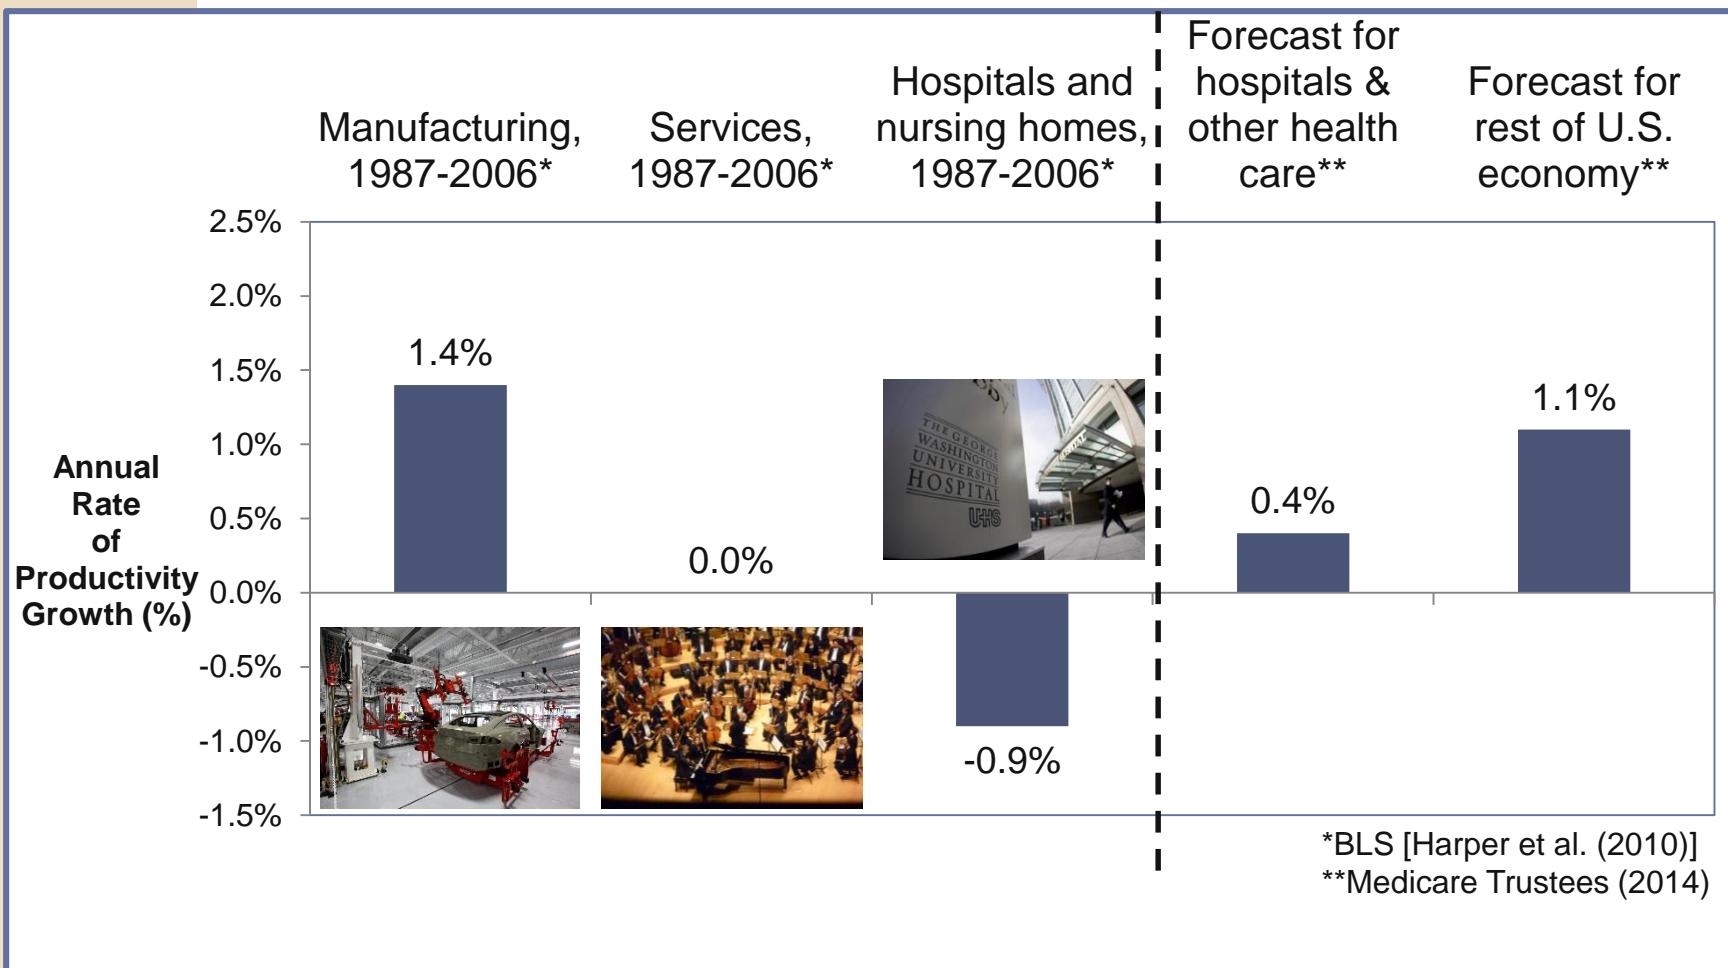

Suppose we are at point 1 and productivity increases in health care

## Sweet spot for public policy: Quality (i.e. health) increases, & cost decreases

## Within the context of a larger debate, productivity growth in health care is a particular concern

# Medicare payments to hospitals and others are tied to productivity growth

## ACA reduces annual “updates” based on productivity growth in broader economy

- In FY 2019, 2.9% increase for inflation reduced by 0.8%

## Adjustment has raised concern about viability of health care providers

The Upshot

Obamacare's Big Gamble on Hospital Productivity

MAY 20, 2015

Austin Frakt

Can hospitals provide better care for less money? The assumption that they can is baked into the Affordable Care Act. Historically, overall economic growth has been slow — in this case, growth in health care spending has been slow. Will Obamacare cut costs?

Medicare Spending Cuts and Hospital Productivity Gains

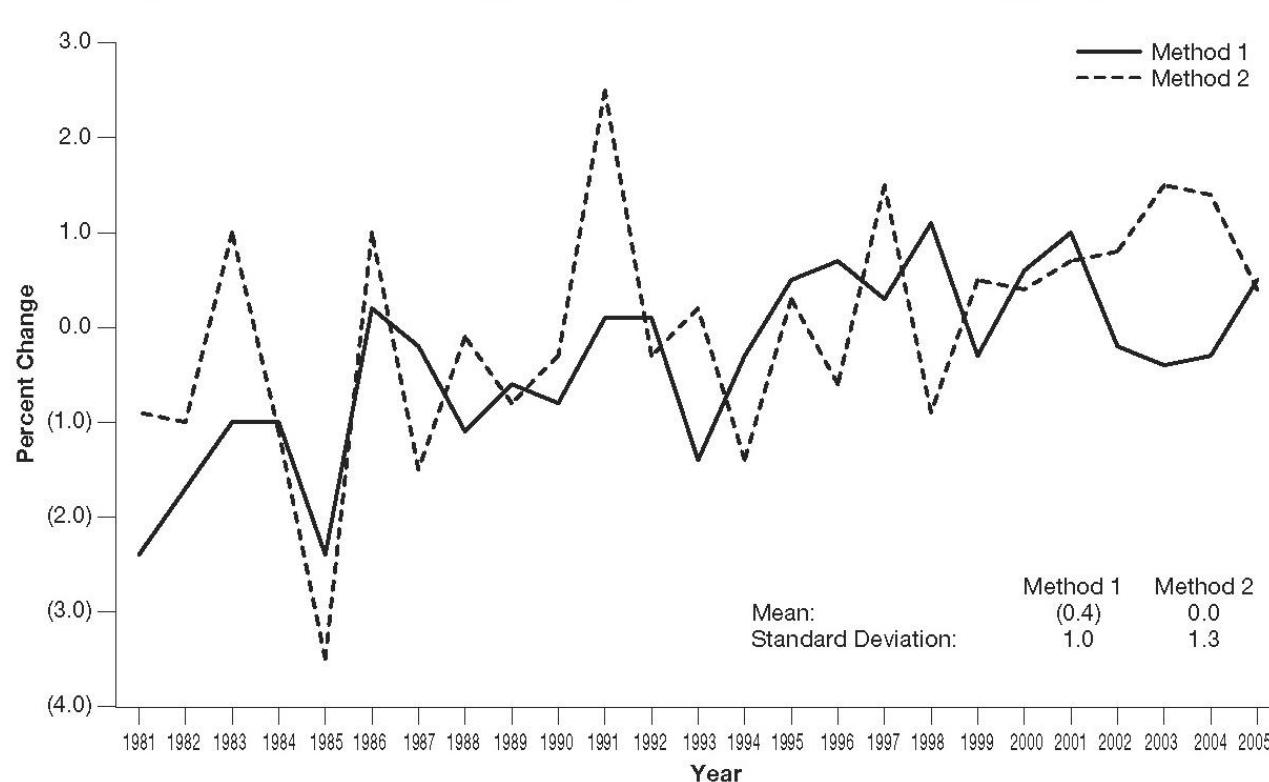

# What we know: 2007 Health Care Finance Review special issue on productivity measurement

Fisher found lagging growth among physicians

# Using two approaches, Cylus & Dickinsheets found no productivity growth in hospitals

Figure 1  
Average Annual Percent Change in Hospital Multifactor Productivity (MFP): 1981-2005

NOTES: Method 1 derives outputs and inputs from select hospital revenues and expenses, respectively. Method 2 generally follows the approach that the U.S. Bureau of Labor Statistics has used to calculate MFP in other industries. Labor quantities are estimated by merging Current Employment Statistics data for total hospital employees with Current Population Survey data for average work weeks and average weekly hours.

**ABSTRACT** The need for better value in US health care is widely recognized. Existing evidence suggests that improvement in the productivity of American hospitals—that is, the output that hospitals produce from inputs such as labor and capital—has lagged behind that of other industries. However, previous studies have not adequately addressed quality of care or severity of patient illness. Our study, by contrast, adjusts for trends in the severity of patients' conditions and health outcomes. We studied productivity growth among US hospitals in treating Medicare patients with heart attack, heart failure, and pneumonia during 2002-11. We found that the rates of annual productivity growth were 0.78 percent for heart attack, 0.62 percent for heart failure, and 1.90 percent for pneumonia. However, unadjusted productivity growth appears to have been negative. These findings suggest that productivity growth in US health care could be better than is sometimes believed, and may help alleviate concerns about Medicare payment policy under the Affordable Care Act.

**H**ealth spending in the United States has grown less rapidly in recent years, compared to its long-term trend.<sup>1</sup> However, the sustainability of the US health care system continues to be a serious concern.<sup>2</sup> Against this backdrop, the Institute of Medicine

in American manufacturing grew by 1.37 percent per year from 1987 through 2006.<sup>4</sup>

Some observers have noted that service industries such as health care may suffer from what has sometimes been called a “cost disease”—in which a heavy reliance on labor limits opportunities for cost efficiencies stemming from tech-

**Neeraj Sood** is an associate professor of health economics and director of research at the Leonard D. Schaeffer Center for Health Policy and Economics at the University of Southern California.

## Analyzed hospital treatment of key conditions within Medicare program

**Dates:** 2002 through 2011

**Population:** Older Americans in fee-for-service Medicare

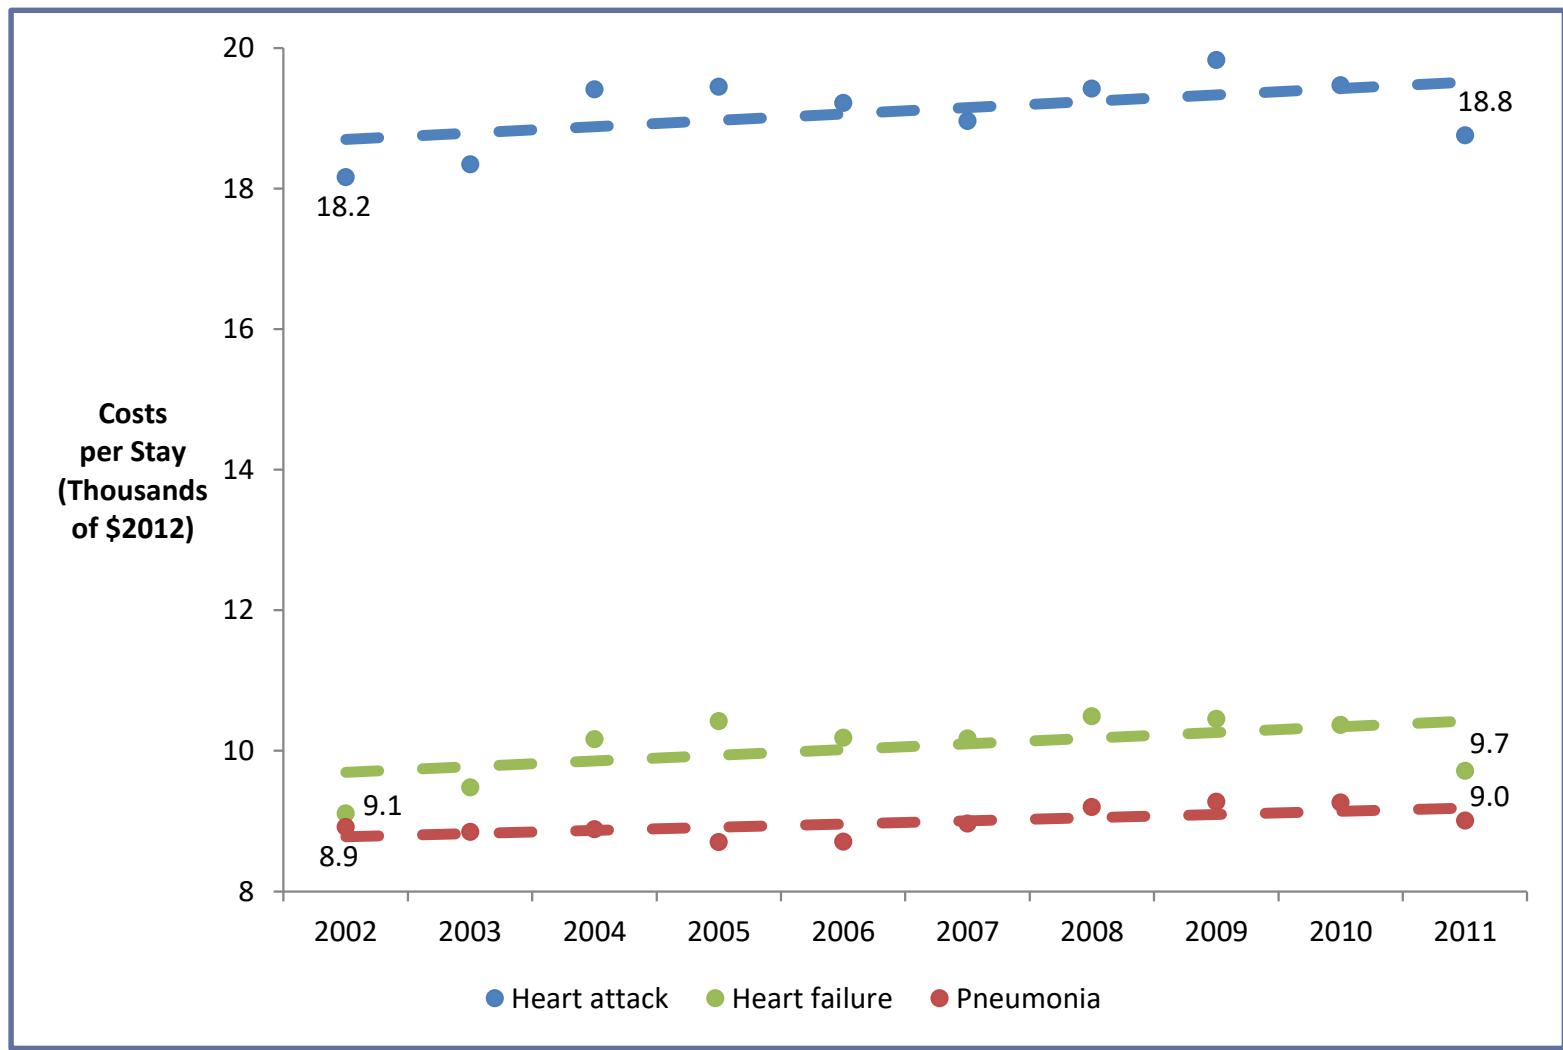

**Data:** Health insurance claims, administrative records and regulatory filings

- Data provide longitudinal perspective on care and outcomes

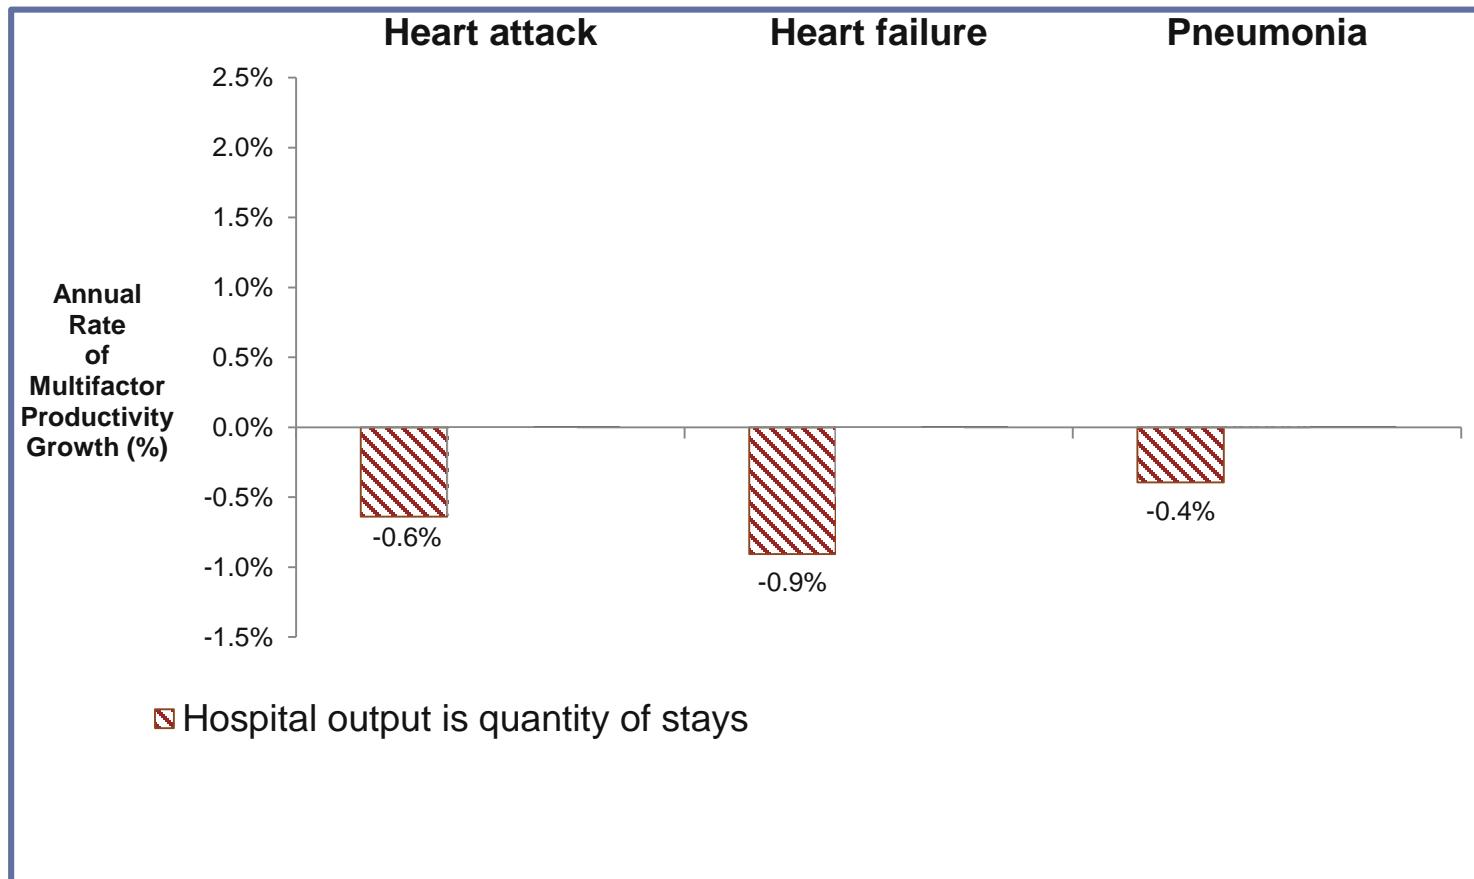

**Conditions:** Heart attack, heart failure, and pneumonia

- Open-source risk adjustment from clinical experts was available

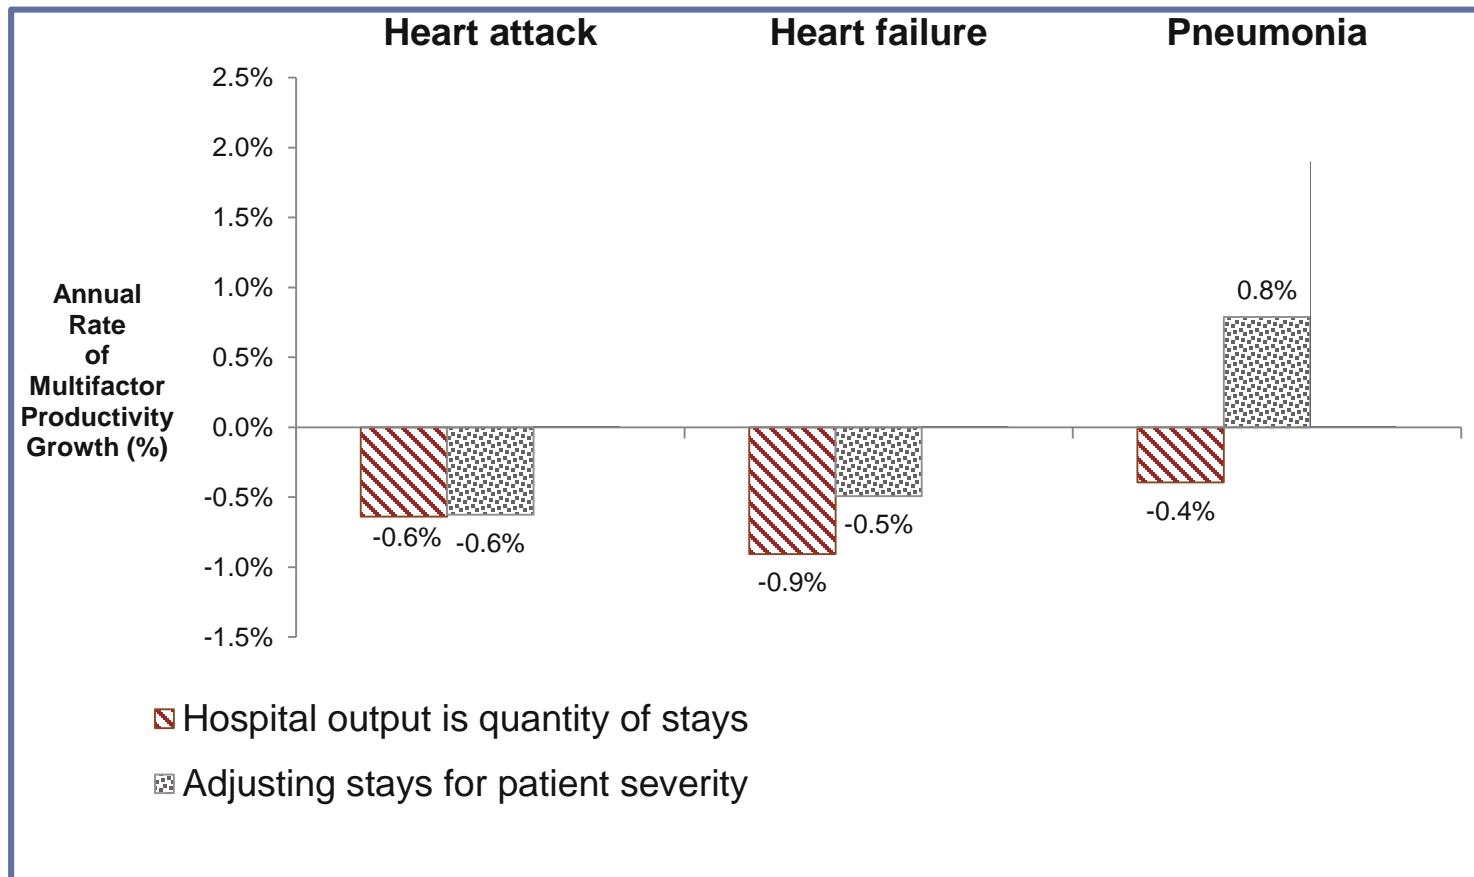

## General trend lines did not point to productivity growth

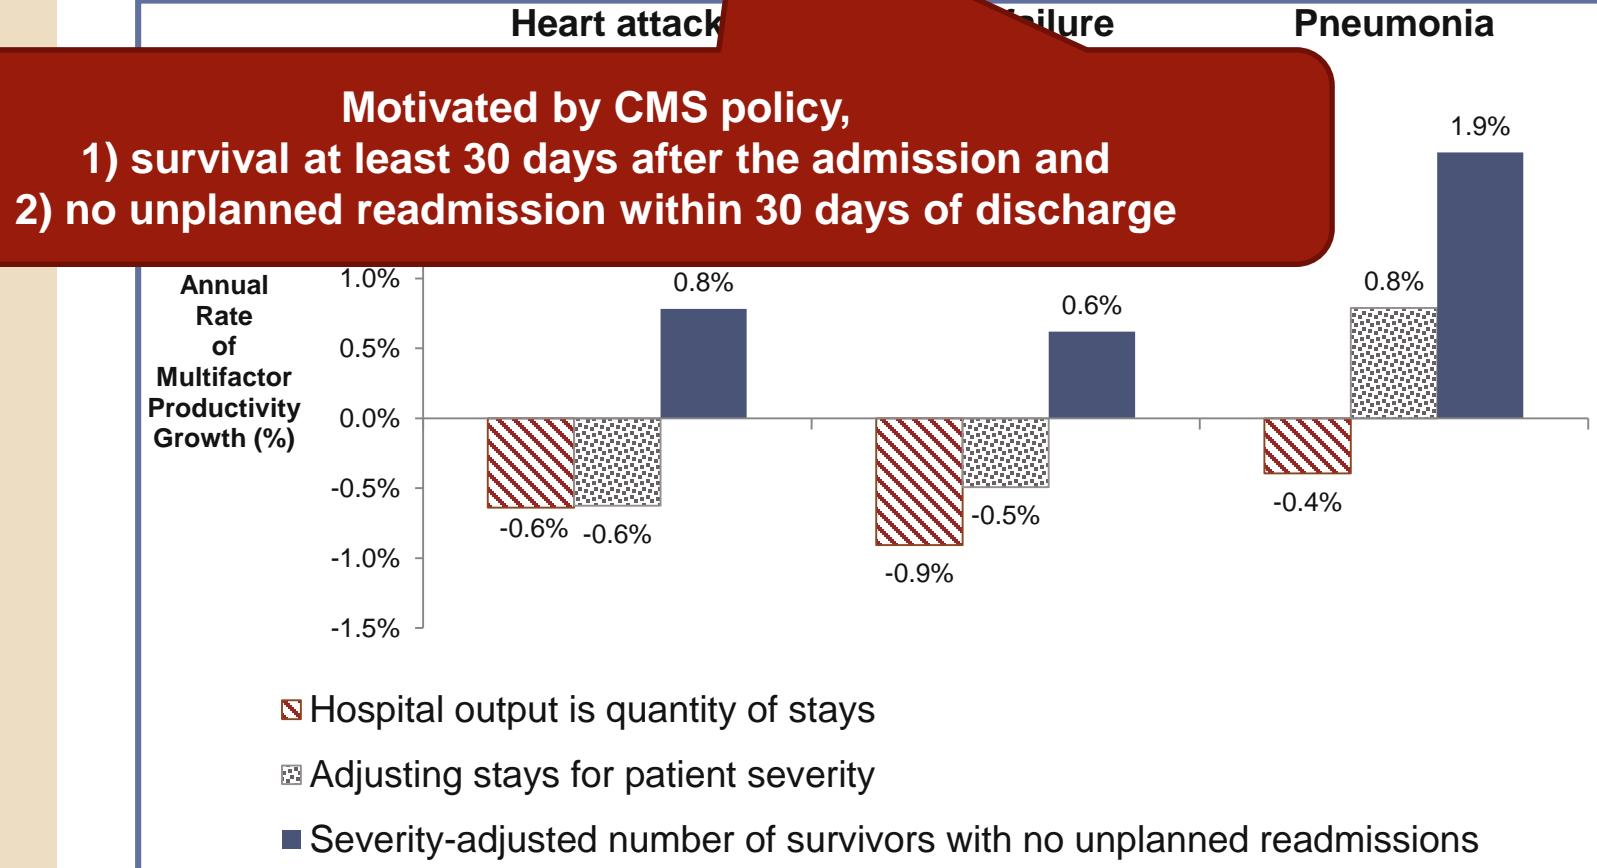

**In regression analysis, “naïve” productivity growth was negative over 2002-2011 for all conditions**

## With adjustment for patient severity, measured growth improves for HF and PN

## When output is “high-quality” stays, U.S. hospitals actually performed well

# Dealing with quality of health care is not a new challenge

## Boskin Commission addressed CPI

- Found upward bias due to improvements in product quality

## Cutler et al. analyzed heart-attack care

- Accounting for better outcomes, price of treatment *decreased*

### ARE MEDICAL PRICES DECLINING? EVIDENCE FROM HEART ATTACK TREATMENTS\*

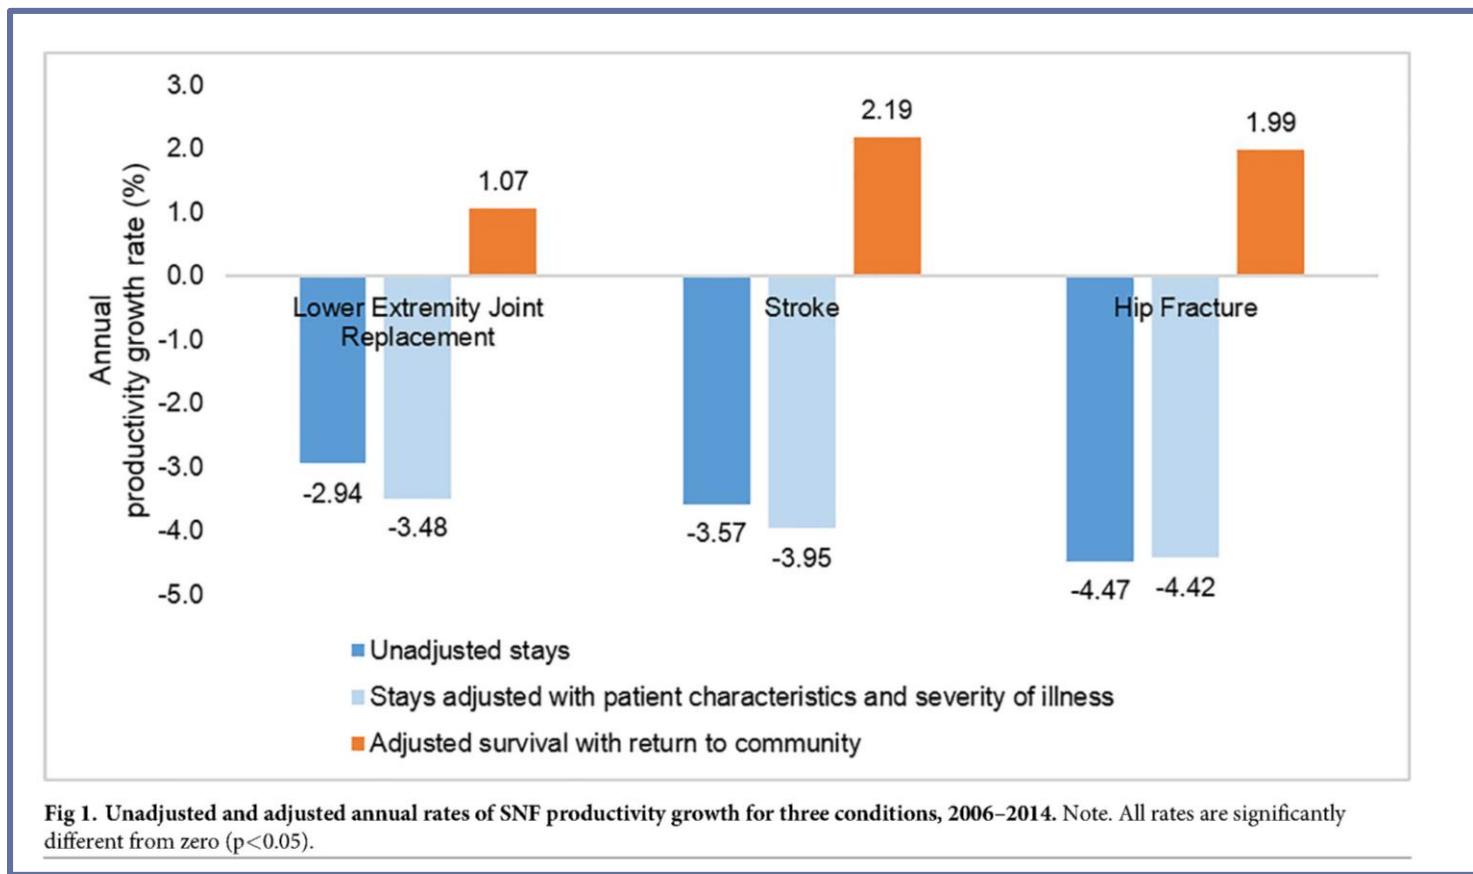

DAVID M. CUTLER  
MARK McCLELLAN  
JOSEPH P. NEWHOUSE  
DAHLIA REMLER

We address long-standing problems in measuring medical inflation by estimating two types of price indices. The first, a Service Price Index, prices specific medical services, as does the current CPI. The second, a Cost of Living Index, measures a quality-adjusted cost of treating a health problem. We apply these indices to heart attack treatment between 1983 and 1994. More frequent reweighting and accounting for price discounts lowers the measured price change for heart attacks by three percentage points annually. Accounting for quality change lowers it further: we estimate that the real Cost of Living Index fell about 1 percent annually.

#### I. INTRODUCTION

The difficulties of deriving accurate price indices for service industries are well-known [Griliches 1992]. In this paper we address the issue of appropriate price indices for medical care. We focus on medical care because it is a large and growing part of the

**CMS Announces Participants in New Value-Based Bundled Payment Model**

Participation is robust in Administration's Bundled Payments for Care Transformation (BPC) Advanced model, which is designed to improve care and reduce costs for hospitalizations & outpatient services.

Today, the Centers for Medicare & Medicaid Services (CMS) announced that 359,000 entities have signed agreements with the agency to participate in the Administration's Bundled Payments for Care Transformation (BPC) Advanced model. The participating entities will receive a fixed payment for certain episodes of care as an alternative to traditional fee-for-service payments.

**New Participants Join Several CMS Alternative Payment Models**

Numbers demonstrate provider commitment to a health care system with better care, healthier people, and smarter spending

Today, the Centers for Medicare & Medicaid Services (CMS) announced over 359,000 clinicians are confirmed to participate in four of CMS's Alternative Payment Models (APMs) in 2017. Clinicians who participate in APMs are paid for the quality of care they give to their patients. APMs are an important part of the Administration's effort to build a system that delivers better care and one in which clinicians work together to have a full understanding of patients' needs. APMs also strive to ensure that patients are in the center of their care, and that Medicare pays for what works
