This volume is a product of an enormous team effort. The editors thank all the chapter authors for their collaborative efforts in contributing their unique insights and expertise in bringing this project to life. The editors are also grateful to Daniel Bicknell for outstanding project coordination and support and for his excellent comments throughout; Odera Onyechi and Charlotte Rivard for tremendous research assistance; Gaoyi Miao for support on fact-checking; Fiker Girma for final production support; Madhulika Jain, Wendy Kneissl, and Mona Tiwary for project copy-editing support; and Jeannine Ajello, Junjie Ren, Andrea Risotto, Esther Rosen, Izzy Taylor, and the Brookings communications team for invaluable communications insights and support.

Many ideas in this volume were forged at an authors’ workshop at The Rockefeller Foundation Bellagio Center. The editors thank the Bellagio Center team for their unyielding support and hospitality, in addition to Linus Mofor, Nicholas Stern, and Marilou Uy for insightful comments and discussions during the workshop. Zia Khan, Kevin O’Neil, and Nicole Rasul also provided invaluable insights throughout the project.

Brookings gratefully acknowledges project support provided by The Rockefeller Foundation.

Brookings recognizes that the value it provides is in its commitment to quality, independence, and impact. Activities supported by its donors reflect this commitment.

Development-Positive: Climate Action in the Most Vulnerable Countries

Sara Jane Ahmed

Introduction: Creation of the Vulnerable Group of Twenty Ministers of Finance

Development-positive is a term the V20 utilizes to establish the particular contexts of its goals: (a) it recognizes not only the urgency of climate action but also the primacy of realizing development outcomes for V20 member countries; (b) the true yardstick of ambition in terms of ‘ambitious climate action’ is the ability of climate vulnerable countries to realize their development goals and achieve prosperity; and (c) the recognition that chasing development objectives aggressively is what accelerates durable, ambitious climate action. In other words, for V20 countries, merely to survive the climate crisis is not enough; they aim to thrive despite or in the face of increasingly dire challenges posed by the impacts of global heating.

Vulnerable countries are often left out of global strategies to avert climate breakdown. Steadily, however, it has been precisely these countries that have built up one of the largest and most consistent coalitions of nations to do just that. Not only have they formed the political backbone of ambition behind centerpiece of global climate policy like the 1.5 degree Celsius goal of the Paris Agreement. They are also a pioneering frontier of economic and financial solutions to fighting the climate crisis. What is more, any lasting solution on climate will require the kind of reform to the international financial architecture—to making debt work for the most vulnerable, to overcoming capital hurdles to
investment, facilitating global exchange via carbon finance, fully integrating climate risks, development finance institutions (DFIs) prioritizing of climate action, and establishing prearranged and trigger-based funds—that these nations have been calling for and which will work for them. Getting the financial system to work for the most vulnerable not only serves the interests of those least responsible and most exposed to this crisis, it will also make the whole world better off.

In 2009, 11 countries from Africa, Asia, the Caribbean, and the Pacific met near Malé, Maldives, to form an international partnership of developing countries most threatened by a global climate emergency. The Climate Vulnerable Forum (CVF), as it was called, has since grown and evolved as a platform to help members act together to deal with climate change. In October 2015, two months before the Paris Agreement, the CVF launched a dedicated group of its ministers of finance, called the Vulnerable Twenty (V20) Group, to translate political ambition into real economy outcomes. It has also identified five thematic ambassadors to take the climate agenda forward and has launched a global parliamentary group to enable parliamentarians from across the CVF member states to share experiences and good practices on legislative measures to accelerate efforts to ensure a supportive climate financing and regulatory environment. As of early 2023, the CVF/V20 spans 58 countries representing almost 1.5 billion people, $2.4 trillion of gross domestic product (GDP), and 5 percent of global emissions. Most pertinently it comprises the set of countries most vulnerable to the impacts of climate change.

**Here and Now Costs**

For V20 countries, climate change is not a distant challenge. It compounds fiscal stress and has set aflame national budgets here and now. Government liabilities are increasing from growing extreme weather events and from managing volatility in fossil fuel prices. As climate-fueled risk intensifies, losses and damages due to insufficient adaptation responses and an almost total lack of financial protection are a fast-emerging major macroeconomic concern for climate vulnerable economies (IPCC, 2022). Climate-fueled impacts permeate through national economies, affecting their infrastructure, supply chains, social protection, and micro, small, and medium-sized enterprises, which a majority of people rely on for employment opportunities.

1. The original CVF members were Bangladesh, Barbados, Bhutan, Ghana, Kenya, Kiribati, Maldives, Nepal, Rwanda, Tanzania, and Vietnam.
The loss and damage from man-made climate change has been quantified at the macroeconomic level by a 2022 “Climate Vulnerable Economies Loss Report” commissioned by the V20 (V20, 2022a). The report concludes that the V20 would have been 20 percent wealthier today had it not been for losses attributable to climate change. The reduction in economic growth was estimated at slightly less than 1 percent each year on average between 2000 and 2019—growth could have compounded at 4.6 percent annually, instead of the 3.7 percent that was registered. However, for the six worst affected V20 economies, the relative economic losses due to climate change since 2000 are estimated to have made challenging situations even worse. These countries only grew at 0.4 percent per year, half the rate at which they would have grown in the absence of climate losses. In aggregate dollar terms, V20 economies are estimated to have lost approximately $525 billion due to climate change over the two decades—a devastating amount of wealth destruction for frontline economies and communities.

The Climate Vulnerable Economies Loss Report found that nearly all V20 economies have already warmed to mean temperatures that are far beyond what would be optimal for generating economic growth, and additional warming will only carry the countries further from the optimum, greatly increasing climate-induced losses. Lack of adaptation to new rainfall patterns could induce losses of −15 percent in Timor Leste, Yemen, or South Sudan; for the majority of V20 countries, losses could be in the range of −5 to −10 percent of GDP. Across the V20 members, the frequency and intensity of extreme weather and weather-related events, including extreme rainfall, drought, cyclones, and wildfires, are increasing, which can compound losses (IPCC, 2021). For example, alterations in rainfall patterns are increasing the frequency of flood events, which increase the risk of infectious disease transmission, loss of assets, and death; while in parallel, the frequency and intensity of drought is rising, putting food and water security at risk (IPCC, 2021).

The same V20-commissioned report is clear on the implications of these trends: Adaptation investments need to accelerate sharply both to prevent loss and damage at current levels, as well as to offset compounding economic losses and damages. The report also provides evidence that international support supplied to V20 economies affected by hydro-meteorological extremes can reduce the negative macroeconomic effect that would otherwise occur, but that such support is scarce. Within the V20, only an estimated 2 percent of assets and livelihoods are protected against adverse shocks, implying a 98 percent “financial protection gap” against climate and disaster risks. This underscores the importance of new, well-funded mechanisms for loss and damage that can be deployed with speed and at scale.
Challenges in Climate Vulnerable Economies

V20 countries have found that the efficient use of power and renewable energy brings cost competitiveness and has been an important job creator. Yet, there is little they can do on their own to make a material difference to global climate change or to self-insure against climate-related losses. The main response and responsibility of V20 governments is adaptation, but this must be done in a context of limited project preparation support, poor bankability of projects associated with a high cost of capital, and few business models that can be viable without financial protection mechanisms. A greater incidence of natural disasters of growing severity makes it ever more difficult to support communities on the frontline. These challenges are compounded by the development overhang of poverty and the lack of access of over 350 million people across the V20 to modern energy services (Ritchie et al., 2022).

Cost of Capital

Climate vulnerabilities are a credit risk multiplier for the V20, raising the cost of capital, risk premiums, and debt levels. Rising debt and cost of capital are not simply the result of the pandemic. These are also products of an out-of-date and out-of-tune global financial architecture that does not address the multiplicity and complexity of risks that V20 finance ministers are required to manage in order to serve their people.

One such risk arises in implementing a transition to clean energy. Because renewable energy investments are capital intensive compared to fossil fuel energy projects, the choice between the two is very sensitive to the cost of capital. Capital costs can vary between 1 and 4 percent in the advanced economies on average, and between 6 and 28 percent in the V20, and this has profound implications for the choice of technology and adaptation (Trading Economics, 2022).

To illustrate the issue, a 2017 UNDP study showed that, in a low financing cost environment, an onshore wind project generates a pretax levelized cost of energy (LCOE) of 6.2 cents/kWh, slightly better than 6.3 cents/kWh for a comparable gas turbine plant. But in a high financing cost environment, the same wind project generates an LCOE nearly 50 percent higher, at 9.2 cents/kWh, compared to 6.7 cents/kWh for the gas project (UNDP, 2017).2

2. In the low financing cost environment, this assumes a 7 percent cost of equity and 3 percent cost of debt. In the high financing cost environment, this assumes a 17 percent cost of equity and an 8 percent cost of debt.
The UNDP report indicates that onshore wind is slightly more cost effective than gas when the costs of equity and debt are at levels seen on average in low financing cost environments (UNDP, 2017). The same projects, however, have radically different cost structures in the high financing cost environment prevalent in V20 countries. There, the gas project becomes significantly cheaper on the outset despite high marginal cost. More expensive financing raises the cost of the onshore wind project by almost one half.

Technology is constantly evolving, so these figures are purely illustrative. However, they underline the complexity of transitioning to a low carbon economy in the V20. A further complication is that V20 countries usually fund such investments with foreign currency denominated debt, while local currency debt is available in the G20. High interest rates and currency risk make V20 investments in renewables far riskier than in the G20. In similar fashion, adaptation is also hard to implement in V20 countries because some (although not all) adaptation projects do not generate immediate cash flows that can be used to service the debt, despite long-term resilience benefits.

The high capital cost and interest rates add to country risk which in turn adds to the expected failure rates of climate-action deals. Climate change could already account for 10 percent of the V20 capital risk premium, and this will grow as climate change intensifies (Buhr & Volz, 2018). Reducing capital costs to levels equivalent to those enjoyed by major emerging economies is crucial for energy projects to become commercially viable and to make them “bankable” or “investable.” Moreover, the cost of capital is even more important for adaptation, resilience, and natural capital projects, where there is a lack of direct revenue streams and returns accrue over a long period of time. This requires concessional resources including low to zero percent interest rate debt and grants.

**Debt**

Funding and liquidity are needed by the V20 to deal with their increasingly complex interlinked crises. Over time, V20 countries have had to borrow funds externally to cope with climate-related and other shocks, and these debts have steadily accumulated. As of late 2022, the V20 as a group has a total of $686 billion in external public debt. This amounts to 27 percent of the group’s GDP and is of the same order of magnitude as the previously mentioned $525 billion in climate-related losses registered in V20 countries since 2000 (Ramos et al., 2022).

The V20’s total debt stock is one fifth of all developing country public and publicly guaranteed debt (Ramos et al., 2022). External debt stocks in V20 countries are held by private creditors (36 percent), the World Bank (20 percent), and other multilateral development banks (MDBs) (20 percent) (Ramos et al.,
Paris Club nations hold 13 percent of V20 debt in official bilateral credits, and China holds 7 percent of the total (Ramos et al., 2022). While their debt compositions vary, Lebanon, Bhutan, the Maldives, and Mongolia have the highest debt-to-GDP ratios in the V20. For Lebanon and Mongolia, private creditors hold most of their debt; for the Maldives, China is the largest creditor. Bilateral debt is the largest share of Bhutan’s debt, but China’s share of debt is uncertain (Ramos et al., 2022).

The liquidity crunch now faced by V20 members is not all of their own making. A global financial system unresponsive to climate change realities means more developing countries are forced into situations of fiscal distress or default, not because of long-term insolvency but due to a lack of cash on hand, hard currency, and exchange rate volatility. These shorter-term liquidity challenges are where the international public finance community and central banks need to help the V20. Debt restructuring, debt-for-climate swaps, and credit enhancement as a climate resilience tool can safeguard creditors’ assets while unlocking new resources.

In terms of external debt service payments, V20 countries owe more than $435 billion in payments to various creditors between 2022 and 2028, with 2024 being a particularly critical year with payments reaching nearly $69 billion (Ramos et al., 2022). Private creditors top the payments list (nearly 35 percent), alongside the World Bank (12 percent), other MDBs (16 percent), and China (10 percent). Colombia has the largest outstanding commitments ($51 billion), followed by Vietnam ($33 billion), Sri Lanka ($31 billion), Bangladesh ($30 billion), and the Philippines ($30 billion) (Ramos et al., 2022).

**Structural Issues**

Beyond the cost of capital and high debt levels, V20 countries face specific challenges due to the structure of their economies. In many countries, the power sector (generation, transmission, and distribution) is largely publicly held, which presents its own complications in terms of technical expertise, access to latest technologies, business models for innovation, and political interference in policy setting and pricing. Beyond that, public finances have been built on a fossil-fuel economy base. Import and sales duties on fossil fuels and automobiles remain an important revenue source for V20 governments. These have to be replaced by other forms of public income as countries transition toward a low-carbon future. Adding to the challenges is the limited financial protection of assets and livelihoods that communities and medium and small enterprises can access. Climate-related shocks, therefore, place an immediate burden on public finance.
Economic Transformation Strategies for a Climate-Insecure World: Climate Prosperity Plans and the V20 Vision 2025

In 2020, at the start of the COVID-19 pandemic, Prime Minister Sheikh Hasina from Bangladesh, during her chairing of the CVF, and former president Mohamed Nasheed from the Maldives, CVF ambassador for ambition, launched the climate prosperity agenda to drive new investment and renewed efforts to deliver on the 2030 sustainable development goals (SDGs) (V20, 2021). Climate prosperity was conceived as describing a state where systemic climate vulnerability had been reversed and where economies had become systemically climate resilient.

Climate Prosperity Plans

An important tool for realizing the climate prosperity agenda is the articulation of a country-led climate prosperity plan (CPP). The aim of CPPs is simple: Launch a decade of progress aimed ultimately at achieving climate prosperity by 2030—not 2050. A CPP is a strategic investment agenda to tackle frontline climate threats while boosting planetary prosperity. It is an investment agenda for economies on the climate frontline that targets prosperity enhancement.

Under the CPP, there are significant opportunities for developed countries, major developing countries, and private capital to strengthen economic partnerships with the V20 in the form of climate-centered investment and trade, including technology transfer and innovative business model creation for a resilient and modernized global economy that crowds in market participants and investors that can bring urgency, scale, and quality of investment.

By integrating measures that counteract climate risks and leverage transition opportunities, the CPP catalyzes a green transition as a byproduct of what is ultimately a smarter development strategy than business as usual. The CPP envisages a decade of progress with 5 years of fast-tracked action. It aims to leverage and scale up the first of trillions in new economic investments needed by 2030—from international, regional, and domestic sources—toward critical infrastructure and services for delivering climate prosperity. The objective is optimized, high prosperity outcomes that deliver fast-paced economic growth, jobs, disposable income growth, positive welfare effects, improved trade, and other critical socioeconomic results, while also rapidly accelerating resilience to climate dangers and low and zero carbon technology deployment, and spurring SDG progress.

The CPPs aim to maximize renewable energy wealth and nature-based solutions. Renewable energy wealth is shared by all and promotes unity because it represents shared abundance, and thus shared opportunity. It can best be exploited in smart energy grids that remove inefficient natural monopolies to
help the energy economy become more inclusive. The vision is to modernize the grid using technology and finance which enables a transmission system that builds retail markets for renewable energy and storage providers, manufacturers, operators, and investors. These markets serve as green finance investment opportunities, with technology transfer and innovative business model creation for a modernized energy economy that crowds in market participants and investors.

Key components of the CPP include scenario analysis and socioeconomic outcomes to shift planning norms and drive key projects and programs. These can drive new investment and proposed legislation and regulation, with itemized financing and investment needs.

As reflected in the CPPs, the V20 Vision 2025 goals to leverage renewable energy wealth and maximized resilience for economic gains are to:

- Accelerate the exploitation of domestic wealth in the form of renewable energy resources of all kinds and promote investments in grid modernization and energy efficiency that benefit domestic businesses.

- Work to end off-grid energy poverty through decentralized renewable energy solutions and the improvement of energy affordability and disposable income for the lowest socioeconomic groups that are most vulnerable to climate disruptions.

- Progressively shift reliance away from costly, price-volatile imported fossil fuels, thereby also reducing external inflationary pressures, improving the balance of trade, and building resilience to price shocks.

- Cut the prevailing 98 percent financial protection sinkhole drive by accelerated climate-related disaster risks in half through upscaled access to risk financing and adaptation.

- Boost job growth ensuring new opportunities, responsive wage replacement support, and worker reskilling.

**Lowering the Cost of Capital**

Lowering the cost of capital starts with optimizing public finance and improving fiscal practices. The V20 is leveraging growing public support for tackling the global climate emergency to develop new sources of public revenue to finance climate prosperity actions, including through carbon pricing, pollution taxation, and other public financing approaches, while ensuring no adverse impacts on the disposable income of the lowest socioeconomic groups who are most affected by climate disruptions. In this, it calls on member states to minimize distortionary subsidies, reform taxation practices, and reform export credit agencies to
progressively eliminate economic activity counteractive to climate prosperity. It further recommends improving the tracking of public climate-related expenditure of all kinds to fully monitor and highlight the extent of growing public spending needs in response to climate challenges.

There are limits to what V20 countries can do on their own. While vulnerable economies bear the brunt of economic damages, including increased cost of capital from evolving transition risk and physical climate risk, they are poorly represented when global agendas are set and dominated by rich developed countries. New forms of economic cooperation that recognize the V20 as a constituency group with whom to engage on the climate emergency can offer an immediate course correction. When members of advanced economies talk about the importance of a rules-based multilateral system, they fail to acknowledge that they are favored by the current rules. Advanced economies do not face the same constraints they impose on other countries within the IMF; their ability to respond to the pandemic and provide record stimulus serves as a stark reminder of the asymmetries within the international financial system. For example, prior to the pandemic, the IMF’s Rapid Credit Facility and Rapid Financing Instrument had quota limits of 50 percent annually and 100 percent cumulatively. This was increased during the pandemic to 100 percent annually and 150 percent cumulatively.

Moreover, there are further access limits for the most vulnerable. For example, under the G20 Common Framework, it would be important to expand eligibility to include climate vulnerable least developed countries (LDCs) and highly indebted countries.

There is an opportunity to work with and benefit from vulnerable country experience and expertise so the global financial system can establish a truly effective, enduring global response. One critical avenue is to sustain reform and establish a fit-for-climate IMF. Its Article IV surveillance activities with all economies should have ongoing efforts to improve its “surveillance” approach to climate risks. In 2018, the V20 advocated for the IMF Article IV instrument to integrate physical climate and transition risks (V20, 2022b). The questions bear repeating—can fiscal space be assessed properly without including physical risk, transition risk, and spillover transition risks? Fossil fuels are sources of financial liability, and they continue to generate new dimensions of financial vulnerability. This is just the starting point.

Debt limits should be rethought and recalculated to consider climate change. Debt flexibility, climate action support, and guarantees should all be linked to avoid liquidity crises and risk of increasing cost of capital.

Allocations of special drawing rights (SDRs), some of which should be rechanneled into the IMF’s newly created Resilience and Sustainability Trust
(RST), can also be aligned with country ownership by making V20 CPPs the core of the reform effort supported by the RST. In fact, the V20 calls on the IMF to align all IMF lending, including the emergency liquidity it is providing to many V20 members, with climate and development goals through CPPS. Through careful engagement with the IMF, V20 countries could seek financing under the RST and perhaps a future expanded use of SDRs to enable new investment and to facilitate a quick recovery aligned with green and inclusive prosperity. Furthermore, the need to reconcile long-term climate and resilience goals through the financing of a CPP program can provide a basis for negotiations to ring-fence financing of a CPP from accompanying IMF programs that may include conditionalities and reforms that jeopardize the ability to make needed adjustments in support of a development-focused climate reform agenda (TCDIMF, 2022).

Equally important is for the World Bank to anchor country climate and development reports in the CPPs. The V20, therefore, calls for support from the G7 and G20 for recognition as an official constituency of the World Bank and IMF. The V20 would contribute the experience and expertise of 58 of the world’s most climate-threatened developing economies. These include LDCs, small island developing states, and nations typically without representation in Bretton Woods Institutions’ discussions and deliberations on monetary and development. The V20 can further contribute to the International Monetary and Financial Committee, the joint World Bank–IMF Development Committee, and other relevant fora agendas. A key starting point is for the IMF and the World Bank to hold regular, biannual meetings with the V20. Joint actions for MDBs and bilateral partners, especially with the G7 and G20, could be developed and recommended through these meetings.

Alongside these measures, the V20 has outlined goals for 2025 to achieve a sustainable trajectory in overcoming cost of capital constraints by directly unlocking at least $30 billion equivalent as a starting point of private sector investments, through more systematic and optimized financial derisking for resilient infrastructure and renewable energy, working through MDBs and national financing institutions (V20, 2021).

To meet this goal, the V20 also supports the call for the World Bank and other MDBs to implement all the recommendations in the 2022 G20 expert panel report on capital adequacy frameworks that indicates that MDBs can significantly expand their financing without jeopardizing their credit ratings (Expert Panel, 2022). The V20 urges multilateral financing institutions to specify climate investment commitments and double international finance for adaptation within the next 30 months. In addition, climate adaptation should be at least 50 percent of the focus of all MDB climate portfolios. To enable
development-positive climate action, it may be key to substantially augment the capital of MDBs.

Another key cooperation opportunity for the G7 and the G20 with the V20 is to bring down the cost of capital through credit strengthening with guarantees instruments, long-term financing, and local currency financing. The benefits this could bring in building robust trade and durable trust cannot be overstated. The V20 is developing an accelerated financing mechanism in order to provide off-balance-sheet guarantees, including the creation of subsidy accounts to enable local currency financing opportunities. This is the next big opportunity for the G7 and G20 to make a quick difference on risks and an economic transformation for climate-vulnerable developing countries.

Financial Protection Cooperation

The V20’s 98 percent financial protection gap is not just a gap, but a sinkhole—one that is a danger to the most vulnerable economies and communities. V20 and G20 states must act now but must also learn to cooperate better, more efficiently, and with a greater sense of urgency. Financial protection becomes more acute given that the debt crisis is perpetuated by the climate crisis. As disasters strike, countries are forced to borrow to replace bridges or roads, and people are forced to borrow to replace homes or jobs that were lost. The losses stack up, one atop the other, and the financing options are shrinking.

The financial protection agenda has evolved from the first G20–V20 InsuResilience Global Partnership launched in 2017 with the aim to protect 500 million poor and vulnerable. What was learned, and what remains critical, is the importance of country ownership and the centrality of building local and regional markets. By 2025, the V20 seeks to cut the financial protection gap in half by supporting the development of regional and local disaster risk financing and insurance, focusing particularly on protection for micro, small, and medium sized enterprises (MSMEs) and social protection for communities (V20, 2021).

In 2021, the V20 and G20 members began working on an expanded risk financing architecture reform agenda under the InsuResilience Global Partnership and, toward 2022, this evolved into the G7–V20 Global Shield against Climate Risks. Losses and damages are happening today and being paid for by communities, enterprises, and economies that cannot afford it. Going on in this way is neither sustainable nor just. The Global Shield raised over 210 million euros in 2022 as a starting point, largely from Germany, and aims to scale over time to match the urgency of the climate emergency. The hope is that experience from the Global Shield can be useful for the United Nations Climate Change
Conference of the Parties (COP) negotiators as they work toward delivering a loss and damage fund.

The Global Shield against Climate Risks works with new and existing partners and institutions to systematically analyze countries’ protection gaps and design, fund, and facilitate needs-based prearranged and trigger-based financing. It has an important role to play through prearranged and trigger-based finance, such as shock resilient social protection, parametric and forecast-based financing for anticipatory action, risk transfer for regional or municipal risk sharing, climate-resilient debt structuring, debt payment suspension and relief, and business liquidity protection, to name a few mechanisms. This financial protection gets delivered in a fast and effective manner for communities, on the sovereign level, and for MSMEs. Prearranged options are important to improve the access, management, and delivery of resources ahead of time, instead of post-disaster. Post-disaster resources usually take about 9 months to deliver, and if the government must borrow, the cost of capital is higher due to heightened instability. The trigger base is important so that resources and financing are unlocked based on data and science instead of after-the-fact assessments, which often place the burden of proof on those most vulnerable.

Moreover, the analytics from the Global Shield can make clear where long-term investments in adaptation are required to build resilience for business continuity and critical functionality of the economy. It is important to also note that the Global Shield works with existing institutions to help them level up and stay relevant to the needs of the most vulnerable.

The Global Shield is proposing an improved system to make financial protection more systematic, coherent, and sustained: composed of an international coordination unit supported by financial vehicles and led by in-country processes. So, instead of having disparate ad hoc projects and programs, solutions are integrated into a package.

Critical to the Global Shield’s success is the building of local and regional risk markets supported by international risk capital across climate vulnerable economies. The Global Shield will kick start in pathfinder countries that are also pursuing CPPs toward attracting new investment this decade. These include Bangladesh, Costa Rica, the Pacific, Ghana, Pakistan, Senegal, and the Philippines.

On the structure, the Global Shield is led by governments and advised by technical partners, including multi-stakeholder processes that draw upon civil society, academia, development partners, the risk industry, and governments. There are three key instruments within the financing structure: A World Bank Global Shield Financing Facility, the CVF and V20 Joint Multi Donor Fund; and the Global Shield Solutions Platform in the Frankfurt School. The aim is to
improve financial protection in a coordinated way that makes protection systematic, coherent, and sustained. A central premise key point is that the vulnerable countries hold the pen in designing the approaches.

Some design elements on the V20 side in the Global Shield include working on a slow-onset risk pool to deal with displacement. Displacement is not just a tomorrow problem; it is already happening today. Other design elements include distribution channels and premium and capital support to drive affordability and an opportunity to recognize value. The V20’s Loss and Damage Funding Program is part of the Global Shield which aims to show how the multilateral system can deliver grants to communities to repair and replace community infrastructure and livelihoods, but also to ensure that adaptation resources are made available to build forward better through more resilience infrastructure and diversified livelihoods.

Altogether, the G7–V20 Global Shield offers important learning on how an element of the global financial system (focused on risk financing) can attempt to coordinate and improve its instruments to deal with the severe threats of climate change. Taking from the call of the V20 in 2018 for a fit-for-climate Bretton Woods system and all the efforts in 2022 in the G20, the G7, and V20 toward this goal, there is hope for the establishment of a fit-for-climate global financial system and for MDBs and international financial institutions (IFIs) to scale up resources, to tailor instruments, and improve access and delivery at both national and community level.

As climate vulnerable economies, enterprises, and communities cannot afford to wait any longer, resources such as access to data, more knowledge sharing and awareness activities, and predictable and accountable finance cannot come at a better time. There needs to be streamlined access to existing models and data and more granular regional and sectoral detail. Capacity to analyze climate risk to capital stock in financial terms is essential to upgrading climate-resilient business models responsive to long-term investment planning. There needs to be people-centered metrics to create safety nets for the most vulnerable. This requires open access to risk and resilience planning analytics. The V20 and the Insurance Development Forum (IDF) have put forward to the Global Risk Modelling Alliance (GRMA) a recommendation to make accessible risk and resilience analytics in order to drive and steer risk information to drive investment. Gaining country-driven views of risk is fundamental to constructing a responsive risk management system of institutions and resources.

More broadly, the V20 continues to pioneer contributions to the global financial protection agenda such as the V20-led Sustainable Insurance Facility hosted in UNEP Finance Initiative Principles for Sustainable Insurance, which aims to drive local market development of climate-smart insurance for business
continuity of MSMEs as crucial growth engines for V20 economies. The V20 has also put together a Loss and Damage Funding Program (see Box 11.1) to demonstrate that loss and damage can be funded effectively and efficiently through existing institutions that require up-scaling, and that loss and damage can be funded in a way that could be scaled globally both geographically and in volume, including to leverage adaptation funding toward project investments that better equip communities to withstand future extreme events. The Loss and Damage Funding Program aims to support communities first in the form of grants which can complement other forms of loss and damage funding. Initial results from financing loss and damage projects are intended to inspire efforts at the UNFCCC level, noting the cover decision of COP27 that includes the creation of a loss and damage fund for vulnerable countries.³ The vehicles of funding for the V20 Loss and Damage Funding Program will be Philanthropic contributions, non-state contributions, the Global Environmental Facility, United Nations Industrial Development Organization, and other partners. The adequate scale for the proposed UNFCCC Loss and Damage Fund should be scaled according to trajectories of warming including increasing resource mobilization efforts in relation to the 1.5 degree Celsius safety limit of the Paris Agreement.

Moreover, the V20 slow-onset risk pool aims to disprove the fallacy that slow-onset risk is uninsurable or that it cannot use the analytics in the insurance industry. There is an analogy with health insurance. There, even chronically ill people continue to benefit from health insurance, under certain conditions and designs. Similarly, financial protection for slow-onset climate risks can be designed even for countries that are known to be vulnerable. Everyone would be better off if an effective market to handle climate risks is built in this fashion.

Debt Restructuring and Immediate Liquidity Cooperation

For V20 economies, the combined systemic risk of high debt servicing costs and climate change could trigger a vicious cycle that depresses revenues and exchange rates and increases the cost of capital—all of which would exacerbate climate vulnerabilities (V20, 2022b). A pressing area for cooperation is on debt restructuring and access to immediate liquidity. V20 countries face considerable climate change–induced macrofinancial risks that threaten debt

³ See Sharm el-Sheikh Implementation Plan: https://unfccc.int/documents/624444
Box 11.1. V20 Climate Change-Related Loss and Damage Funding Program

Looking forward to 2023, taking the call of the V20 in 2018 for a fit-for-climate Bretton Woods system and all the efforts in 2022 in the G20, the G7, and V20 toward this goal, there is hope for the establishment of a fit-for-climate global financial system and for multilateral development banks and international financial institutions to scale up resources, to tailor instruments, and to improve access and delivery at both national and community level.

The new V20 program focused on loss and damage aims to demonstrate how funding can be efficiently channeled through existing institutions. A range of investment types will be eligible:

**Community infrastructure projects**

Repair and reconstruction of the following affected community buildings damaged by extreme weather events, disasters, shocks, and impacts:

- Health and medical clinics and facilities, including hospitals, community clinics, and other medical facilities
- Educational facilities, including schools, teachers training facilities, student accommodation, and other educational facilities at the primary or secondary level
- Housing infrastructure, including social and public housing, or community-held accommodation facilities
- Utilities infrastructure, including water and sanitation facilities, power lines and electrical grid infrastructure, roads, bridges, dams, dikes, drains, and other community utilities infrastructure.

**Livelihood assets projects**

Replacement, repair, and/or reconstruction of the following affected community or private livelihood assets damaged by extreme weather events, disasters, shocks, and impacts:

- Livestock, crops, stored foodstuffs, and grain
- Livelihood resources, including tools and implements
- Private houses
- Temporary housing and relocation
- Pumping and filtration costs to replace/re-stock contaminated water sources
- Natural (i.e., blocked waterways/rivers/roads) or human-origin (i.e., strewn waste and damaged goods) rubble removal.
Coral reef restoration

- Restoring reefs negatively impacted by climate change (ocean warming, heat events and acidification)
- Enhance reef resilience in response to coral loss/bleaching

Adaptation component projects

- Elements of investments which contribute to rendering the replaced or repaired infrastructure, community assets, or community itself more resilient to future extreme weather events, disasters, shocks, and impacts.

Development/reconstruction/humanitarian/disaster risk reduction component programs

- Elements of investments in addressing loss and damage to community infrastructure or livelihood assets which could probabilistically not be attributed to climate change (nor specifically relate to climate change adaptation funding).

sustainability and that harm investment and development prospects. To have effective delivery of climate finance requires a fit-for-climate global financial system and institutions enabled to support economies at the frontline of the climate emergency. Considering international volatility and spiking prices of fossil fuels, decarbonization should be thought of as a resilience building strategy to reduce exposure to inflationary pressures and volatility. It requires more systematic planning on how adaptation, resilience, and the low-carbon transition can be financed—especially in countries facing dire debt sustainability challenges.

The V20 recommends unpacking, redesigning, and improving options such as debt-for-climate swaps and climate-smart debt restructuring with debt relief elements. In 2021, 2022 and 2023, the V20 called for sovereign debt restructuring architecture reform (see Box 11.2). V20 member circumstances should be incorporated into debt sustainability analyses. All creditor classes can work together to reduce the level of debt in V20 countries through guarantee facilities and regulatory action to mobilize new financing for climate and development goals. For example, creditors to the V20 economies could consider debt restructuring options (e.g., debt servicing payments to climate resilience and energy transition investments and debt for climate swaps) (V20, 2022b).
Box 11.2. The CVF/V20 Advocated for the Following Outcomes During COP27

- Loss and damage: The creation of a new dedicated fund for loss and damage specific only to “particularly vulnerable” developing countries.

- Adaptation (finance): An implementation plan on the doubling of adaptation through the commissioning of a UNFCCC report by the Standing Committee on Finance into the doubling of adaptation finance by 2025.

- Mandate for the development of a framework for the Global Goal on Adaptation and for adaptation efforts to be transformational.

- Keeping 1.5 degrees Celsius alive: Stronger language than in Glasgow, “urging” governments who failed to so to align their Paris Agreement 2030 nationally determined contribution emission targets with 1.5 degrees Celsius by 2023 at the latest.

- Finance: Explicit calls to establish a fit-for-climate global financial system and for MDBs and IFIs to scale up and simplify access to climate finance.

- Voluntary carbon markets: COP27 advanced the implementation of Article 6 of the Paris agreement. Article 6.2 permits countries to meet with net zero goals by paying for emissions reductions in another country. Article 6.2 working rules are starting to be implemented after being agreed to at COP26. At COP27, Ghana and Switzerland authorized the first-ever “internationally transferred mitigation outcome” under Article 6.2 (Luhn, 2022).

Elements of financial system reform from the October 2022 V20 communique (V20, 2022b)

- “An immediate reform of the sovereign debt restructuring architecture. Debt sustainability analyses need to be tailored to V20 member circumstances. Then, through guarantee facilities and regulatory action, all creditor classes must reduce the level of debt in V20 countries in order for them to mobilize financing for their climate and development goals.”

- “The World Bank and other MDBs to implement all of the recommendations in the G20 expert panel.”

- “Multilateral financing institutions to specify their commitment to climate investment and to deliver at least a doubling in international finance for adaptation within the next 30 months, with all MDBs ensuring their climate portfolios are at least 50 percent focused on climate adaptation.”

- “Further allocations of SDRs, some of which should be “rechanneled” into the IMF’s newly created RST that should be enshrined in country ownership whereby V20 CPPs form the core of recovery efforts.”
• “Sustain reform and establish a fit-for-climate IMF with ongoing efforts to review, rethink, and continuously improve its ‘surveillance’ approach to climate risks of all kinds in its Article IV surveillance activities with all economies. Likewise, it is important to rethink and recalculate IMF debt limits to take into consideration climate change, and to link debt flexibility and support to climate action along with guarantees, to avoid liquidity crises and cost of capital repricing.”

Source: V20 Ministerial Communique IX (V20, 2022b).

Elements of financial system reform from the April 2023 V20 communique

• “Call on the IMF to align its lending toolkit with the Paris Agreement by increasing the scale of available financing and by reforming its toolkit to help countries mitigate short-term macroeconomic imbalances in a manner that accelerates medium-term and longer-term climate resilient development pathways.”

• “Urge the IMF to better reflect the diversity of national circumstances and approaches to climate policy beyond carbon pricing in its surveillance work. We encourage the IMF to further refine its analytical tools—such as debt sustainability analysis—to better capture climate risks including cross-border transition risks, and their macro-critical impacts, and resource mobilization needs while also supporting capacity building efforts to strengthen climate policy analysis and the development of domestic markets for sustainable finance.”

• “Urge a decisive way forward to deliver climate finance through an ambitious share of world GDP to secure a sustainable future for the global economy amid the escalating climate emergency, and a downscaling of financial resources that undermine the fight against climate change.”

• “Call for new quantified climate finance targets to include loss and damage and to be anchored on-the-ground realities consistent with what is actually required to transform economies to expand adaptive capacity, climate resilience, and effect energy transitions that hold warming to the 1.5 degrees Celsius survival limit of the Paris Agreement.”

• “Having advocated for the USD 500 billion Delivery Plan and an Implementation Plan for how climate adaptation finance can reach an equal footing with mitigation finance, we look forward to the COP27 mandated report by Standing Committee of Finance to report on adaptation finance flows to ascertain progress on the COP26 decision whereby developed countries would ensure at least a doubling of adaptation finance by 2025.”

• “Call on multilateral financing institutions to deliver at least a doubling in international finance for adaptation within the next 24 months, with all Multilateral Development Banks (MDBs) ensuring their climate portfolios are at least 50% focused on climate adaptation. In particular, we call for the
tripling of the concessional International Development Association (IDA) financing for IDA eligible countries.”

- “Propose for a guarantee facility through an Accelerated Financing Mechanism for inclusive, sustainable and resilience-building efforts whereby MDBs act as guarantors of restructured debt. This guarantee facility could help move the multilateral efforts on debt relief forward by encouraging diverse creditors to resolve debt workouts in a timely and sustainable manner. We encourage the IMF to play a strategic role through the Resilience and Sustainability Trust in debt restructuring by providing collateral to guarantee restructured debt.”

- “Mobilize existing and additional multilateral guarantee funds including subsidy accounts for currency hedges to maximize renewable energy and adaptation towards energy security and food security.”

- “Seek premium and capital support towards building domestic and regional markets through the Sustainable Insurance Facility, and for the key financing vehicles within the G7–V20 Global Shield against Climate Risks to always act in the best interest of their ultimate clients, the climate vulnerable countries and particularly least developed countries and small island developing states.”

- “Determined to drive the success of the Sustainable Insurance Facility for enterprises and supply chains and to do so we must not only prepare capital markets to accept risk but also cover last-mile infrastructure to aggregate demand such that risk is priced efficiently and climate-vulnerable populations access effective risk transfer.”

- “Seek support to rapidly scale-up last-mile capacity in demand aggregators such as supply chains, government agencies, and other institutions which reach climate-vulnerable populations such that efficient infrastructure is in place for large numbers of small individual risks to transfer into contingent group savings and risk pools, as underscored by efforts under the G7–V20 Global Shield against Climate Risks.”

- “Seek further support for our domestic financial institutions to have cost effective mechanisms to rebuild balance sheets immediately after a shock created by climate-fueled risks.”

- “Continue to implement the Global Risk Modelling Alliance (GRMA) for risk analytics and modelling support to drive adaptation and resilience efforts and for supply-side capital markets’ access to data and capital to accelerate competitive pricing of risk in an environment that is increasingly volatile.”

- “To co-create win-win carbon financing exchanges that can help meet global goals, deliver fair-share action, and provide crucial financial support for ambitious climate action that would otherwise not be viable. Specifically, we point to Climate Prosperity Plan projects including natural capital assets, in exchange for returns on investment and internationally transferred mitigation
outcomes (ITMOs) which can be credited to relevant investments and debt repayments.”

• “Urge COP28 to deliver the mandate for the rapid evolution of all multilateral institutions including the Global Environment Facility to fully integrate loss and damage as an instrument, inclusive as a separate new program of work, and a new addition to country envelopes, and for the financial architecture to include loss and damage instruments as part of the composition of support.”

• “Further to philanthropic funding and non-state government commitments to the V20 Loss and Damage Funding Program, resource mobilization for loss and damage can include wealthy and high-emitting governments, non-state government institutions, Individual and micro-contributions including through crowdfunding and as led by students/youth, non-profit organizations, associations, etc., corporate contributions, innovative financing instruments including financial transactions tax (FTT) on financial trades, carbon pricing and emissions trading revenues, and airfare and transport ticket levies (voluntary or mandatory).”

Fit-for-Climate International Financial System

When we talk of a planet on fire due to the planetary climate emergency it can be easy to forget that we also have a world economy already in systemic turmoil. Getting the financial dimensions right in our global, interconnected economy is indispensable to a proper response to both challenges. In April 2023, the V20 shared the Accra-Marrakech Agenda (A2M) a prescription for an international financial system fit for the climate as it spans action needed across debt, financing, carbon, and risk that can bring about a robust financial system that is responsive to the climate crisis (V20, 2023b). It leaves behind the current system which continues to attenuate, efforts to tackle climate change while it worsens risks and vulnerabilities. V20 leadership is clear: they are determined to galvanize global support for its implementation by the time the lynchpin conference for the world economy this year takes place at the IMF and World Bank’s annual meetings in Marrakech.

The realization of the A2M and Bridgetown Initiative would deliver what climate vulnerable economies expect: a transformation of the global financial system and a world economy that brings us together and leaves nobody behind as we fight for individual and collective survival.

The urgency of the climate crisis requires swift, concerted global action through the A2M’s four pillars:
1. Make debt work for the most vulnerable and overcome cost of capital hurdles: Current debt profiles and the way analytics on debt sustainability is conducted are alarming; they do not enable but effectively disable development-positive climate action. The risk and uncertainty of climate-fueled events punishing climate-vulnerable economies, enterprises, and people’s livelihoods, have brought higher costs of capital and spiraling debt levels. Rapid reform of the Common Framework is needed to allow all debt-distressed, climate-vulnerable economies to obtain necessary debt relief in a predictable, efficient, and timely manner so that V20 countries can leverage new financing through guarantees and other incentives and pursue new investments for development-positive climate action under the V20’s Climate Prosperity Plans.

2. Transform the international and development financial system: A decisive shift of financial flows as agreed in the Paris Agreement is required to transform economies this decade. For as long as public international and development finance continue to support carbon-intensive and climate-heating and risky/non-climate future-adapted investments instead of green and resilient ones, the transformational potential of the transition is undermined. Public development and international finance must complete their transition pre-2030 underpinned by development strategies into evolving national plans including Climate Prosperity Plans. To start, the optimized use of capital in the multilateral system and development finance institutions can add momentum including with a tripling of IDA. The International Monetary Fund also has a key role to play by using its Special Drawing Rights (SDRs) and Administered Accounts as wrap-around guarantees and enhanced access to the Resilient and Sustainability Trust (RST). Global capital markets through dedicated listing boards on major stock exchanges can play a role if also supported by little-to-no-cost currency risk hedges to make accessible local currency financing.

3. A new global deal on carbon financing: This is required to realize the goal of the Paris Agreement in the near term, prior to the 1.5°C overshoot. This demands substantial strengthening of 2030 climate targets of major polluting economies that can be enabled through the promotion of ambitious development-positive climate action in low-emitting developing economies. Win-win carbon-finance exchange can help meet global goals, deliver fair-share action, and provide crucial financial support for ambitious climate action that would otherwise not be viable.
4. Revolutionize risk management for our climate-insecure world economy: The doubling down on efforts to accept and address the new climate-insecure reality of the world economy through revolutionizing risk management and put in place with anticipatory finance with pre-arranged and trigger-based funds for loss and damage and mainstream surveillance and monitoring of climate risks of all kinds (physical, transition, spillover) in IFI finance and credit rating practices, including through the landmark G7–V20 Global Shield against Climate Risks. Financial regulators have a key role to play to ensure all leading credit rating agencies fully account for climate risks (physical, transition, spillover) in their assessment methodologies of public and private economic entities and capital/debt instruments and securities (inclusive of derivative markets) to incentivize climate action and penalize climate incompatible businesses and investments in the near-term (by 2025 at the latest).

The Summit on the New Global Pact has the potential to deliver the four pillars of A2M with timelines within this decade to restore trust, knowing far tougher decisions need to be made everywhere when the new decade comes in.

Conclusion

The implementation of the Paris Agreement must go beyond COP negotiations and into the real economy with multilateral reform as a critical step to complete over the next two to three years. This would ensure that development aid and economic cooperation does not end up exacerbating the climate crisis, because genuinely effective development support should help countries meet climate goals. By mainstreaming development and economic cooperation considerations into climate finance and likewise climate considerations into development aid, countries should be encouraged to tackle the two intrinsically linked challenges together. Doing so avoids conflicting investments or duplicating efforts in a period when resources are expected to remain scarce. In particular, any and all increases in climate finance must not come at the expense of development aid, because a country’s ability to meet its climate goals is directly tied to its capacity to realize its development priorities. An effective approach to additionality must focus on ensuring that development aid and climate finance are both scaled up sufficiently to meet both the SDGs and Paris climate objectives.

Moreover, the challenge to uproot fossil fuels from V20 economies is not just a battle for the climate. It is also to reduce price spikes and all the instability and energy insecurity they carry. V20 states cannot promote growth by obstructing development. They cannot rise if enterprises and the welfare of communities are tied to a fossil fuel industry in long-term decline.
Advanced economies and large emerging economies already have cost-effective technology in the form of renewables, energy storage, and grid upgrades to displace unreliable, volatile, expensive, and economically harmful fossil fuels. There will be tradeoffs for sure in the energy transition, but the historic choice of accelerating transformation will bring greater stability and energy security sooner. For example, partnering with China on elements such as grid modernization can bring an opportunity with climate vulnerable countries that together represent the demand for transformational strategies for over 2.6 billion people worldwide, one third of the whole world’s population.

A historic choice lies before the world’s governments. Amid a time of conflict, developing countries and emerging economies are in a strong position to establish the direction everyone should take in realizing world peace, because accelerating the energy transition and resilience enables energy security, secures national sovereignty, and enhances territorial integrity by highlighting what is actually shared across borders—wind, solar, and moving water, and shared prosperity. More importantly, there is an opportunity to course correct the global financial architecture to deliver for economies that face extreme vulnerability and to shift financial flows toward the 1.5 degree Celsius safety limit of the Paris Agreement. To this end, moving into 2023, the reform of the global financial architecture to making debt work for the most vulnerable, to overcoming capital hurdles to investment, facilitating global exchange via carbon finance, fully integrating climate risks, DFIs prioritizing of climate action, and establishing prearranged and trigger-based funds.

About the Center for Sustainable Development at Brookings

The Center for Sustainable Development generates leading research, insights, and convening to advance the economic, social, and environmental challenges of global sustainable development and help implement the Sustainable Development Goals (SDGs) within and across all countries.
To set a more robust global path to net-zero emissions by 2050, the world needs to pay greater attention to the needs of emerging markets and developing economies (EMDEs), even when holding aside the special case of China. Over the coming several decades, no part of the world will play a greater role in both experiencing and affecting global climate change outcomes than EMDEs themselves. They need greater international support to tackle growth-enhancing sustainable development strategies.

In *Keys to Climate Action*, twenty-five authors describe new economic narratives and global actions that can help catalyze progress toward inclusive, sustainable, and resilient growth in EMDEs. The volume begins with the stark reality of climate change’s devastating consequences already hindering economic development around the world. It underscores the need for urgent investments in adaptation, resilience, and nature to avoid development setbacks while paying heed to the world’s narrow window for climate action. It requires empathy for many developing countries’ profound energy conundrum: a tension between the need to expand access for people who need it most while facing pressures to pursue low-carbon opportunities, often in the face of local political and financing headwinds. It implies practical urgency in tackling the broken threads of the international financing system for climate and development.

The volume brings together a cross-section of distinguished academics and leading policy voices from a variety of developing country geographies and contexts. It presents perspectives on the country-specific climate and development challenges and opportunities in Bangladesh by SALEEMUL HUQ and MIZAN KHAN, Egypt by HALA ABOU-ALI, AMIRA ELOYUTE, and MAHMoud MOHIELDIN, India by MONTEK SINGH AHLUWALIA and UTKARSH PATEL, Indonesia by MUHAMAD CHATIB BASRI and TEUKU RIEFKY, Nigeria by BELINDA ARCHIBONG and PHILIP OSAFO-KWAAKO, and South Africa by RICHARD CALLAND. Then, broader case studies focus on regional issues in East Africa by NJUGUNA NDUNG’U and THÉOPHILE AZOMAHOU, across the African continent as a whole by VERA SONGWE and JEAN-PAUL ADAM, in Latin America and the Caribbean by DANIEL TITELMAN, MICHAEL HANNI, NOEL PEREZ BENITEZ, and JEAN-BAPTISTE CARPENTIER, and among the Vulnerable Twenty Group of Ministers of Finance of the Climate Vulnerable Forum by SARA JANE AHMED. A final chapter by MONTEK SINGH AHLUWALIA and UTKARSH PATEL focuses on systemic issues in financing development and climate-driven prosperity.

AMAR BHATTACHARYA is a senior fellow in the Center for Sustainable Development at the Brookings Institution, where he specializes in global economy, development finance, global governance, and the links between climate and development. He co-led the Independent Expert Group on Climate Finance commissioned by the U.N. Secretary-General and has served as Executive Secretary of the Independent High-Level Expert Group on Climate Finance. HOMI KHARAS is a senior fellow in the Center for Sustainable Development at the Brookings Institution, where he specializes in analyzing policies and finance in support of sustainable development. He was lead author and executive secretary of the U.N. Secretary-General’s High-Level Panel on the post-2015 development agenda. His previous books include *Breakthrough: The Promise of Frontier Technologies for Sustainable Development* and *Leave No One Behind: Time for Specifics on the Sustainable Development Goals*. JOHN W. MCArTHUR is a senior fellow and director of the Center for Sustainable Development at the Brookings Institution. He previously served as deputy director of the U.N. Millennium Project and is co-founder and co-chair of the 17 Rooms initiative for the Sustainable Development Goals. His previous books include *Breakthrough: The Promise of Frontier Technologies for Sustainable Development* and *From Summits to Solutions: Innovations in Implementing the Sustainable Development Goals*.
